December 2021

EUROMOD version 14.0

EUROMOD is the tax-benefit microsimulation model for the European Union (EU). It enables researchers and policy analysts to calculate, in a comparable manner, the effects of taxes and benefits on household incomes and work incentives for the population of each country and for the EU as a whole.

EUROMOD covers the 27 Member States and is yearly updated to cover the most recent changes in countries' policy systems. It uses input databases which are also updated on a yearly basis, coming mainly from the European Union Statistics on Income and Living Conditions (EU-SILC). The model yearly update is supported by the following Directorate-Generals of the European Commission: DG EMPL, DG ECFIN, DG TAXUD, DG REFORM, DG JRC, DG ESTAT.

Originally maintained, developed and managed by the Institute for Social and Economic Research (ISER), since 2021 these responsibilities are taken over by the Joint Research Centre (JRC) of the European Commission, in collaboration with Eurostat and 27 national teams from the EU countries.

The EUROMOD governance structure consists of a Steering Committee, allowing partner DGs to monitor the process of the EUROMOD update, and a Scientific Advisory Board to monitor and guide the scientific development of the model.

This report documents the work done in the most recent annual update for Czechia. This work was carried out by the EUROMOD core development team, based at the JRC in Seville, in collaboration with the national team.

JRC B2 head of unit: Salvador Barrios

EUROMOD project leader: Alberto Tumino/Fidel Picos

EUROMOD coordination assistant: Daniela Hupteva/Marta Jędrych

EUROMOD software developer: Estefanía Vázquez Torres

EUROMOD developer responsible for Czechia: Adrián Hernández Martín

National team for Czechia: Klára Kalíšková, Daniel München and Jan Pavel

The results presented in this report are derived using EUROMOD version I4.0. EUROMOD is continually being improved and the results presented here may not match those that would be obtained with earlier or later versions of EUROMOD.

For more information see <https://euromod-web.jrc.ec.europa.eu/>

The information contained in this document does not reflect the position or opinion of the European Commission.

1. BASIC INFORMATION

1.1 Basic information about the tax-benefit system

- The tax-benefit system is unified. There are no exceptions.
- The tax system can be generally changed in January each year. Main benefit changes happen at the same time but may also be implemented in June.
- Retirement age is different depending on the age of the person, for women it also depends on the number of raised children. The pension age has been increasing by two months for men and four months for women for each year since 1996 until the end of 2036 when it will reach the maximum of 65 years for all persons born in 1971. Minimum school leaving age is 15. A dependent child is classified as a child that has not yet finished compulsory schooling, or until 26 years old if he or she is training for future employment; or, alternatively, if the child cannot train for future employment because of injury, long-term illness or if the child is not able to work.
- The means-tested benefit system assesses entitlement according to benefit unit income. The benefit unit is the nuclear family - the couple (cohabiting or married) or single adult plus any dependent children.

1.2 Social Benefits

Social benefits can be broken down into the following categories according to the Czech legislation:

A) Benefits based on compulsory insurance

A.1 Retirement benefits

Pension system contains five types of pensions: old-age pensions, full invalidity pensions, part-invalidity pensions, widow or widower pensions, and orphan pensions. The last three types of pensions are collectively referred to as survivors' pensions.

A.2 Sickness benefits

Sickness benefit (*nemocenská*): this benefit is paid for all days that a person is disabled, but not more than for one year (or at most two years if the person is disabled due to work injury). The amount of the benefit is calculated from the daily benefit base.

Benefit for Treatment of a Family Member (*ošetřovné*): this benefit is for treatment of a family member for a person caring for an ill child under ten, or caring for a person over ten if required. The person undergoing treatment must live in the same household as the benefit recipient. The benefit is paid for at most nine days, or at most 16 days if the person caring for a child younger than 10 lives alone with the child in the household.

Maternity Allowance (*mateřská*): this is a contributory benefit for the period of maternity leave. Available to employees and insured self-employed persons. The benefit can also be claimed by the father of the child if he is a substitute carer. The benefit is paid to mothers/substitute carers of adopted/foster children. The maternity allowance is paid for maximum of 28 weeks (including 6-8 weeks before the childbirth).

Paternity Allowance (*otcovská*): one-week paternity leave (of seven calendar days) – which can be taken within six weeks after the childbirth will be introduced from 2018. Fathers will be entitled to the similar conditions as mothers on maternity leave.

A.3 Unemployment benefits

Unemployment benefit: is short term benefit, which is available for unemployed individuals actively searching for a job.

B) State social support

All benefits provided through the state social support are not taxable and may be divided into means-tested and non-means-tested benefits. General net household income for the purpose of testing eligibility for the state social support is defined as taxable income for the purpose of income taxation, stipends, housing supplements from employers, bonuses, alimony, sickness benefits, unemployment benefits, income from abroad and pensions. Net profit from entrepreneurial activity is included if it is greater than zero. But if the income from business is the major source, its contribution to the income for the purpose of testing eligibility for social benefits cannot be lower than 50% of average wage in previous year. A family is defined for the purpose of state social support (except housing benefit for which all persons of the same domicile address are considered in the same unit of assessment) as a person, dependent children, parents of dependent children, spouses or partners, dependent children of dependent children (if they are not married, widowed or divorced) if they live with the person in the same household and meet the cost of living together. If a dependent child is under 18, the condition of meeting the costs of living together is not required. If a dependent child is over 18 and under 26 and is training for future employment, the condition of meeting the costs together is not required if the child has the same domicile address as her parents. A spouse is considered to be a unit member.

A dependent child for the purpose of state social support is classified as a child that has not yet finished compulsory schooling and until 26 if he or she is training for future employment (i.e., is in education); or, alternatively, if the child cannot train for future employment because of injury, long-term illness or if the child is not able to work. A child between the end of compulsory schooling and 18 is also dependent if registered at a district labour office and not receiving unemployment benefit. A child receiving an invalidity pension in the third degree is not considered a dependent child.

Parental allowance (*rodičovský příspěvek*): this is a benefit to all parents who personally provide full-time care for a small child up to 4 years of age. It is available to all families who meet the eligibility condition whether or not they take parental leave; as parents can work full time or part time while receiving parental benefit, it can be considered as a benefit to subsidise care costs, as well as a home care benefit for at-home parents. It has a contributory and non-contributory part. The contributory benefit is proportional to earnings of one of the parents (whoever earnings are higher). There is also a non-contributory benefit for families where none of the parents have acquired contributions.

Birth grant (*porodné*): a lumpsum flat-rate income-tested birth grant available to a mother for the first and second parity births.

Child allowance (*příspěvek na dítě*): is basic long-term benefit provided to families with dependent children.

Housing benefit (*příspěvek na bydlení*): should help households to cover the costs of housing.

Funeral grant (*pohřebné*): is available to a person arranging a funeral for dependent child.

C) Social care benefits

Social care benefits are monthly allowances paid to disabled people. The amount of care allowance corresponds to the degree of “dependence on care” which is based upon an assessment of ability to manage the above mentioned 10 basic living needs.

There are 4 levels of dependence:

- Grade I (slight dependence);
- Grade II (medium-heavy dependence);
- Grade III (heavy dependence);
- Grade IV (total dependence).

D) Foster care benefits

Foster care benefits are a special part of the Czech benefit system, which are provided to foster parents for the care of foster children. It has two basic parts: a foster parent's reward and a contribution to the child being entrusted. Foster parent's reward has the nature of wages and its amount is dependent on the number of children and type of foster parent (classical, professional). The child continues to be entitled to this allowance even after reaching adulthood, up to a maximum of 26 years of age, provided that they remain a dependent child and live under the same roof as their former foster parent(s).

E) Social assistance benefits

Social necessity benefits: they serve as a last resort. When a net household income including any state social support benefits is less than the family-level MLS, the household is entitled to social necessity benefit. The system is organized around a key parameter — the so-called minimum living standard (MLS). There are three types of benefits:

- **Allowance for Living** – a benefit for poor households.
- **Supplement for Housing** – a benefit for poor households, which are burdened with high housing costs.
- **Extraordinary immediate assistance** – a one-off non means-tested benefit for the poor to solve unexpected problems. This is provided to persons who find themselves in situations that have to be resolved immediately (e.g. a serious threat to health, a natural disaster, a release from custody or from prison, etc.). The amount is based on an individual assessment of the circumstances of the applicant.

1.3 Social contributions

The social contributions in Czechia can be divided into two parts:

Social insurance and state employment policy contributions: they consist of pension insurance, contributions for the state employment policy and sickness insurance. The participation in this system is compulsory for all persons who have income from work and business (in this case is sickness insurance voluntary).

Contribution for public health insurance: it is administrated by special public bodies – health insurance companies. The participation in this system is compulsory for all persons. The contribution of persons, who cannot have income from work and business, is paid by the state budget.

1.4 Taxes

The current Czech taxation system was introduced in 1993. While direct taxes include income tax and real estate tax, indirect and property taxation consists of value added tax (VAT), excise taxes, road tax, real estate tax and the tax on the transfer of real estate.

Income Tax (*daň z příjmu*) is paid by corporations and individuals. The corporate income tax is 19% of gross profit. Personal income tax is paid by any person who has residence or lives in Czechia for at least 183 days in a year. Taxable income includes all income earned in Czechia and abroad. The tax rate is flat and equal to 15%. The second tax bracket with the additional tax rate (+ 7 %) was introduced since 2013, but it is relevant just for the income, which is taxed by social security contribution.

Real Estate Tax (*daň z nemovitých věcí*) has two parts: Land tax and Building tax. The tax is paid by the owner of land or building but the rates are very low.

Value Added Tax - VAT (*daň z přidané hodnoty*) is levied on the supply of goods, real estate transfers, services provided in Czechia and imported goods. A typical VAT taxpayer is an entrepreneur or a company with headquarters or outlet in Czechia if their turnover was higher than 1,000,000 CZK in the last 12 months or if they are registered as a voluntary taxpayer. VAT taxpayers may claim a return on the tax paid to other VAT taxpayers if the goods are used as inputs for production. The difference between VAT on sold goods and services and VAT on inputs is termed VAT tax duty. If the tax duty is negative, VAT taxpayers receive a refund. The standard VAT rate is 21% with, first preferential rate of 15% and second preferential rate of 10 %.¹ The last is levied e.g. on books, medical goods and food for small children.

Excise Tax (*spotřební daň*) is levied on mineral oil, alcohol, beer, wine, tobacco and tobacco goods. The tax is levied on goods made in or imported to the EU.

Road Tax (*silniční daň*) is paid by entrepreneurs for each vehicle used for business purposes and for all vehicles above 12 tons irrespective of use, except vehicles designated for agricultural purposes.

1.5 COVID-19 related tax and benefit measures in 2020

In order to reduce the negative economic impact of the COVID-19 pandemic, several tax and benefit measures have been implemented:

- Compensation Bonus - direct support for self-employed persons in the amount of CZK 500 per day. The period for which it is paid is March 12 to June 8 and October 5 to December 31.
- Reduction of social and health insurance contribution for self-employed persons by 50 % of contribution. However, the reduction cannot be higher than six times the minimum contribution base.
- Temporary increase in benefit for treatment of a family member.
- Programme Antivirus – wage compensations for employers, which are affected by the COVID-19 pandemic.
- Programme Antivirus C - forgiveness of social security contributions for employers with up to 50 employees for 3 months.
- One-off bonus of CZK 5,000 for any recipient of old-age, disability or widow's/widower's pensions.

¹ The VAT rates (standard / preferential) increased in the last years a lot, the rates were 19% / 5% till 2007, 19% / 9% in 2008 and 2009, 20% / 10% in 2010 and 2011, 20% / 14% in 2012 and 2013, 21%/15 % in 2014 and 21%/15%/10% since 2015.

1.6 COVID-19 related tax and benefit measures in 2021

- Antivirus program (except Antivirus C) continues, although it is expected to close at the end of June.
- Compensation Bonus continued until January 31. Then a new system was introduced and the amount was increased to CZK 1 000 per day. The new system ended at the end of May.
- Extraordinary benefit to employees during ordered quarantine was introduced. It will be available since March to June 30. This benefit provides CZK 370 for each quarantine (isolation) day up to a maximum of 14 days. Due to lack of data on quarantined individuals, the benefit is not simulated in EUROMOD. In fiscal terms this benefit is expected not to have significant budgetary consequences.

2. SIMULATION OF TAXES AND BENEFITS IN EUROMOD
2.1 Scope of simulation
Table 1: Simulation of benefits in EUROMOD

	Variable name(s)	Why not fully simulated?				
		2018	2019	2020	2021	
Sickness Benefits	bhl	I	I	I	I	The amount of benefit depends on the previous income and length of sickness.
Maternity allowance	bmact/bmact_s	I/S	I/S	I/S	I/S	Due to lack of data on contribution history and maternity. Its simulation can be switched on by activating PBE extension. The default for the baseline is off, i.e. the non-simulated component is being used (bmact).
Paternity allowance	bpact_s	S	S	S	S	However, the simulation is switched off in the baseline. Its simulation can be switched on by activating PBE extension.
Passive employment policy benefits	bun_s	PS	PS	PS	PS	The amount of benefit depends on the previous earning stream for a period of time, and on time spent in previous employment, and on length of past periods of unemployment.
Child Allowance	bch00_s	S	S	S	S

Employer's SSC	tscer_s	S	S	S	S	Includes all components of ils_sicer (i.e. contributions to pension, unemployment, sickness and health insurances)
Entrepreneurs SSC	tscse_s	S	S	S	S	Includes all components of ils_sicse (i.e. contributions to pension, unemployment, sickness and health insurances)
State funded public health insurance contributions	tschlgv_s	S	S	S	S	
Employer	tscterpi_s	S	S	S	S	Pension insurance. Simulation switched off in the baseline.

EUROMOD Country Report – CZECHIA

credited contributions through wage compensation	tsccterui_s	S	S	S	S	Unemployment insurance. Simulation switched off in the baseline.
	tscctersi_s	S	S	S	S	Sickness insurance. Simulation switched off in the baseline.
	tsccterhl_s	S	S	S	S	Health insurance. Simulation switched off in the baseline.

Notes: “-” policy did not exist in that year; “E” policy is *excluded* from the model’s scope as it is neither included in the microdata nor simulated by Euromod; “PS” policy is *partially simulated* as some of its relevant rules are not simulated; “S” policy is *simulated* although some minor or very specific rules may not be simulated.

- ***Structural changes between 2018 and 2019***

No changes.

- ***Structural changes between 2019 and 2020***

In connection with the COVID-19 epidemic, a compensation bonus for self-employed and wage compensation programs (Antivirus) were introduced.

- The programme Antivirus is targeted at employers, which are affected by the COVID-19 pandemic. Employers whose economic activity will be at risk due to spread of the infection will be granted a contribution to reimburse, in whole or in part, the wage compensations of employees because of an obstacle on the part of employees (quarantine) or on the part of employers (obstacle – closure of business due to the Government order to close business operation) if it is proved that the obstacle to work is due to COVID-19 pandemic.
- The compensation bonus comes as a direct support for self-employed persons in the amount of CZK 500 per day, if the self-employed declares that he/she has not been able to perform this activity in whole or in part due to the COVID-19 pandemic.

As response to COVID-19, some additional measures were also put in place:

- A one-off bonus of CZK 5,000 for any recipient of old-age, disability or widow’s/widower’s pensions was approved.
- Self-employed were exempt from paying minimum contributions from March to August.

Finally, other policies also changed substantially between 2019 and 2020. In particular, the parental allowance increased from CZK 220,000 to CZK 300,000 for single childbirth and from CZK 330,00 to CZK 450,000 for multiple childbirth. The Minimum Living Standard (MLS) indicator also experienced a significant increase in 2020.

- ***Structural changes between 2020 and 2021***

Antivirus and compensation bonus programs continue. The parameters of the Antivirus program remain the same and its termination is being considered at the end of June 2021. In the case of the Compensation bonus, its amount has doubled since February. The program ended at the end of May.

Introduction of a new progressive tax schedule, including two tax rates - 15 and 23%. The boundary between tax brackets is set at the level of the maximum contributory base of social security contribution.

2.2 Order of simulation and interdependencies

The order of simulation in Czechia starts with the wage compensation scheme for employees (*Programme Antivirus*), as after its simulation employment incomes will be recalculated according to the duration of the compensation. Only then employee, employer and self-employed social insurance contributions are simulated. Right after the compensation bonus for the self-employed is simulated and, similarly to the wage compensation scheme, self-employment incomes are recalculated according to the duration in compensation². Note that in this case, self-employed social insurance contributions are not adjusted after the simulation of the compensation bonus (i.e. they keep paying out of their social contribution bases)³. Next, the personal income tax is simulated, as all elements are ready to be included in the tax base. Social benefits are simulated after income tax as they are tax exempt and, when they are means-tested, the income tests are based on net income. The order of simulation of benefits takes into account the “cumulative nature” of their income tests. The income test of Housing Benefit is the same as the Child Allowance plus this benefit. As for Social Assistance, its income test is the same as the previous one plus Housing Benefit. The simulations finish with the credited health contributions paid by the state as the eligibility to Social Assistance is needed for their simulation.

2.3 Policy extensions

There are three standard extensions included into the Czech EUROMOD spine:

Minimum Wage Adjustment (MWA), allowing the user to switch on/off the minimum wage simulation. The default for the baselines is off.

Parental Benefits Extension (PBE), allowing the user to choose between the observed (non-simulated) parental leave benefits (extension off) or the simulated ones (extension on). The default for the baselines is off.

Full Year Adjustment (FYA), allowing the user to choose between policies as of 30th June (extension off) or modelling annual policies (extension on), taking into account within-year policy changes. The default for the baselines is off.

Apart from the above-mentioned policy extensions, the Czech model also includes one policy that is switched OFF in the baseline, but can be used for specific purposes:

TransLMA_cz. This policy defines the individuals that are selected to undergo transitions to monetary compensation schemes and/or unemployment. The transitions are only enabled if used together with the Labour Market Adjustments (LMA) add-on (i.e. the LMA add-on switches on this policy automatically). The transitions are based on a random allocation of individuals and they might be triggered by feeding the parameters of this policy with official or hypothetical information⁴. This policy, in combination with the LMA add-on, enables the simulation of the wage compensation

⁴ For more information about the modelling of labour market transitions, please consult the “Simulating labour market transitions in EUROMOD” document.

scheme (*Programme Antivirus*) and the self-employed compensation bonus (*Kompenzační bonus*).

2.4 Social benefits

Main reference amounts used for calculating social benefits or income testing are discussed below.

- **Minimum Living Standard (MLS)**

The system is organized around a key parameter — the so-called Minimum Living Standard (MLS). This amount is calculated at the personal level and is intended to reflect the cost of living. Most types of benefits are then defined as given percentages of the family-level MLS.

The construction of MLS has one element. Amounts of MLS are different for single person, first adult in family, another adult in family and for children (three categories according to age).

Table 4: The amounts of MLS in CZK per month

<i>MLS (in CZK per month)</i>	<i>2017-2019</i>	<i>2020*-2021</i>
Single	3,410	3,860
First person in household	3,140	3,550
Second and other persons who are not a dependent child	2,830	3,200
Subsistence Minimum (CZK)	2,200	2,490
Dependent child aged		
○ under 6 years	1,740	1,970
○ 6 - 15 years	2,140	2,420
○ 15 - 26 years	2,450	2,770

* Effective from April 2020. Change introduced in the model by using the FYA switch. If the switch is set to on, the amounts of the MLS are calculated as a yearly average.

- **Minimum self-employment income for income test of social benefits**

If person in the family has the income from business as the main income, its contribution to the income for the purpose of testing eligibility for social benefits cannot be lower than 50 % of average wage in previous year. Employment is the main income if there is obligation to pay sickness insurance. This means that monthly earnings are at least CZK 2,500 per month until the end of 2018. Since 2019, this limit is CZK 3,000.

Table 5: Average and minimum wage

	2018	2019	2020	2021
Average wage:				
in previous year	29,638	32,051	34,578	35,662
in Q1-3of previous year*	28,761	31,225	33,429	34,611
Minimum wage:	12,200	13,350	14,600	15,200

Notes: * Economy-wide average wage in the first three quarters of the preceding year

2.4.1 Unemployment Benefits - (bun_cz)

Unemployment benefits are available for individuals actively searching for a job who were employed for at least 12 months in the previous two years and who are not receiving an old-age pension, full invalidity pension or sickness benefits. The employment record required to be eligible for unemployment benefits includes the time taken preparing a partially disabled person for a job, military or civil service, custody of a child less than three years old or a disabled child

EUROMOD Country Report – CZECHIA

up to the age of 18, custody of disabled person above 80 or partially disabled relatives above 80, and the time of receiving disablement benefit.

The benefit entitlement for people less than 50 years is 5 months; from 50 to 55 years are 8 months and over 55 years, 11 months.

Table 6: Characteristics of the unemployment benefit

		2018	2019	2020	2021
Eligibility	Contribution period	employed for at least 12 months in the previous two years			
	Other conditions	not receiving an old-age pension, full invalidity pension or sickness benefits			
	Eligibility of self-employed	participation in the pension insurance scheme at least 12 months in the previous two years			
Payment	Contribution base	Employees: average net wage in the last employment Self-employed: contributory base of social insurance			
	Basic amount	in the first 2 months equal 65% of the contribution base, next 2 months it is 50% and for the remaining time it is 45%			
	Additional amount	in case of retraining the amount is 60 % of the contribution base and maximum amount is 65% of the economy-wide average wage in the first three quarters of the preceding year			
	Floor	the first two months 15% of the average wage in the first three quarters of the preceding year, for next two months it is 12 % and for the rest of the period it is 11 %*			
	Ceiling	58% of the economy-wide average wage in the first three quarters of the preceding year			
Duration	Standard (in months)	5			
	Special cases (in month)	8,11			
Subject to	Taxes	No			
	SIC	No			

Notes: * *Minimum threshold is not implemented in EUROMOD due to data constraints.*

In case of voluntary withdrawal from the work, entitlement to unemployment benefit begins after 6 months and the coefficient for calculation of unemployment benefit is reduced to 45%.

- **EUROMOD notes**

Effectively, this benefit is only partly simulated in the baseline using the information about actual receipt. But rather than only using the observed receipt as part of the eligibility criteria, all eligibility rules in full detail are covered. However, as not all required information (e.g. work history) is available several assumptions are made, among else considering some rules automatically fulfilled for those observed in receipt of this benefit. This approach is chosen so that the benefit can be also modelled for those currently employed if needed (e.g. to simulate their entitlement if they become unemployed, for replacement rates calculations). We cannot simulate either whether an individual withdraws voluntarily from their job due to lack of information on reasons for withdrawal from work and incidence.

2.4.2 Child Allowance (*příspěvek na dítě*) - (bch00_cz)

- **Definitions**

Child allowance is a benefit provided to families with dependent children.

- **Eligibility conditions**

Child lives with his parents in the same household.

- **Income test**

Income of the family is less than 2.7 times the family's living minimum. The net household income which is tested for the purpose of child allowance is the general net household income plus parental allowance. The relevant period for the income test is the calendar year prior to the year when the income is tested.

- **Benefit duration**

No time restriction.

- **Benefit amount**

Table 7: Amount of monthly child allowance per child in CZK, 2018-2021

Age of the dependent child	Amount of monthly child allowance per child in CZK
Up to 6 years of age	500
From 6 – 15 years	610
From 15 – 26 years	700

If at least one person in the household has income from employment, which is equal or higher than the MLS of the single person, then the value of the benefit is increased by CZK 300 per child. The same applies to a situation where at least one person in the household has income from business or receives benefits from the system of pension insurance, sickness insurance or unemployment benefit and parental benefit.

- **Subject to taxes/SIC**

Exempt.

- **Take up**

Almost all entitled households take up this benefit.

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

No changes.

2.4.3 Housing Benefit (*příspěvek na bydlení*) - (bho_cz)

- **Definitions**

The housing benefit contributes to cover housing costs for families or individuals with low incomes.

- **Eligibility conditions**

The income of all persons at the same domicile address must meet the income test.

- **Definition of jointly assessed persons**

All persons with the same domicile address.

• *Income test*

If the housing costs of family are higher than 30% (35% in Prague) of the net household income, while the housing costs are at most the normative costs (see tables below). The normative costs are declared by the Ministry of Labour and Social Affairs (MPSV), reflecting the number of persons in the household, the number of inhabitants in the municipality, and the type of housing (rental and other). If the net household income is lower than the MLS, the household is entitled to the benefit if its housing costs are higher than 30% (35% in Prague) of the MLS. The definition of net income is the same as in the case of child allowance plus child allowance.

In case of rental flats, the housing costs are defined as payment for rents plus costs of heating, costs of water, etc. In other cases, instead of payment for rents the calculation works with the amounts presented in the Table 8 in column 1 plus costs of heating, costs of water etc. In both cases (rental and non-rental) the costs of heating in case of using coal are set out in the following table in column 2.

Table 8: Parameters for calculation of the housing benefit (CZK) in case of non-rental housing and heating with coal, 2018

Number of persons in family	The amount relevant in case of non-rental housing	Costs of heating in case of using coal
	(1)	(2)
1	1,988	746
2	2,721	1,020
3	3,558	1,335
4 and more	4,291	1,649

Table 9: Monthly normative costs (CZK), 2018

Normative costs of housing in rental housing (CZK / month)					
Number of persons in family	Number of inhabitants in the municipality				
	Prague	Above 100,000	50,000 – 99,999	10,000 – 49,999	below 10,000
1	7,870	6,227	5,928	5,036	4,844
2	11,186	8,938	8,530	7,308	7,046
3	15,116	12,176	11,642	10,045	9,702
4 and more	18,827	15,282	14,639	12,712	12,299

Normative costs of co-operative housing and owner housing					
Number of persons in family	Number of inhabitants in the municipality				
	Prague	Above 100,000	50,000 – 99,999	10,000 – 49,999	below 10,000
1	4,420	4,420	4,420	4,420	4,420
2	6,489	6,489	6,489	6,489	6,489
3	8,939	8,939	8,939	8,939	8,939
4 and more	11,298	11,298	11,298	11,298	11,298

- **Benefit duration**

No time restriction.

- **Benefit amount**

The difference between the housing costs and 30% (35% in Prague) of the net household income. In case of using MLS as the net household income it is the difference between housing costs and 30 % of MLS.

- **Subject to taxes/SIC**

Exempt.

- **Take up**

If the model uses the reported data about the housing costs, it shows extremely high non-take up. The values given by households as housing costs were strongly above the average values produced by Statistical Office. In addition, items included in the survey (such as taxes, charges for waste) are not relevant for the calculation of the benefit. To solve this problem, the model reduces the reported housing costs by the coefficient of 0.66, which was estimated by comparison of reported values and external statistics.

- **Changes in 2019**

New normative costs and other parameters for calculation of the housing benefit (CZK).

Table 10: Parameters for calculation of the housing benefit (CZK) in case of non-rental housing, 2019

Number of persons in family	The amount relevant in case of non-rental housing	Costs of heating in case of using coal
	(1)	(2)
1	2,050	781
2	2,805	1,068
3	3,668	1,397
4 and more	4,424	1,727

Table 11: Monthly normative costs (CZK), 2019

2.4.4 Parental Allowance (*Rodičovský příspěvek*) - (bfapl_cz)

- *Definitions*

This is a benefit for one of the parents who personally provide full-time care for a small child up to 4 years of age.

- *Eligibility conditions*

A parent is entitled to parental allowance when s/he personally provides full-time care for the youngest child in the family and the child's age is maximum 4 years. A child under the age of 2 may attend a nursery, kindergarten or other similar facility for children up to a maximum of 45 hours per month. There is no limitation on service use for older children.

- *Income test*

The parent's income is not tested; the parent may carry out an occupational activity without losing their entitlement to parental allowance. However, during the period of this occupational activity, the parent must ensure that the child is in the care of another adult.

- ***Benefit duration***

Parental allowance is provided until the total amount of 220,000 CZK is drawn, maximum up to 4 years of child's age. A parent may select the amount of parental allowance and thus the period of its drawing under the condition that at least one parent in a family is a person participating in sickness insurance.

- ***Benefit amount***

The amount of parental benefit depends on the selected period of receipt. The longest option is until the child is 48 months old and the shortest period is 6 months, with the maximum payment of the same amount as the maximum payment for maternity leave. If the recipient wants to choose an option leading to payments of more than 7,600 CZK per month, the proposed amount per month cannot be higher than 70% of the 30 times the Daily Assessment Base (DAB) used for the determination of maternity benefit. When the DAB can be determined for both parents, the higher one is used for calculation.

The choice of the amount, and consequently, the duration, of parental allowance can be changed every 3 months. No matter which option is chosen, the maximum amount payable for the whole period (up to 4 years) is CZK 220,000, but it will increase to CZK 330,000 for multiple childbirth from 2018 on.

If the DAB cannot be set for any parent, parental allowance is paid at fixed monthly amounts of CZK 7,600 until the child reaches 10 months and afterwards at the amount of CZK 3,800 until the child is 48 months old.

- ***Subject to taxes/SIC***

Exempt.

- ***Take up***

The number of men receiving parental benefit in comparison to women is negligible. In 2017 a little more than 5,000 men received the parental benefit, i.e. 1.8% of all recipients. Most parents take the leave until their child's third birthday (when the entitlement to leave ends, although they can still continue to receive the benefit) as they prefer not to lose their jobs.

- ***EUROMOD notes***

Most people in Czechia fulfil the conditions for selecting optional duration and consequently a monthly amount of the benefit. We assume that contributory benefit is received for 36 months (this is when the statutory period of parental leave ends), which means a monthly benefit up to the amount of 6,111 CZK.

We do not have information as to whether parents of children up to 2 years used a publicly-funded ECEC service for more than 45 hours a month, hence this condition is not modelled and overestimation of the receipt is possible.

Due to the lack of data about the receipt of the benefit by parents whose children are diagnosed with a long-term disability, this component is not modelled.

Due to lack of information in the underlying data, the benefit is partially simulated in the baseline using the information about actual receipt. However, a full simulation can be activated by switching on the Parental Benefits Extension (PBE). In that case, and as the benefit amount depends on the previous earnings, we assume those to be equal to the imputed wage (*yivwg*) or the current wage, whichever is higher. The imputed wage is recorded in hourly terms, hence we assume a country-specific standard number of hours worked per week (40 hours) and we recalculate *yivwg* in monthly terms ($yivwg * 40 * (52/12)$).

- ***Changes in 2019***

Changes in DAB as for maternity allowance.

- **Changes in 2020**

Changes in DAB as for maternity allowance.

The maximum amount payable for the whole period increased to CZK 300,000 for single childbirth and CZK 450,000 for multiple childbirth.

A child under the age of 2 may attend a nursery, kindergarten or other similar facility for children up to a maximum of 92 hours per month.

If the DAB cannot be set for any parent, parental allowance is paid at fixed monthly amounts of CZK 10,000 until the child reaches 30 months.

- **Changes in 2021**

Changes in DAB as for maternity allowance.

2.4.5 Birth Grant (*Porodné*) - (bchba_cz)

- **Definitions**

Lump sum means-tested birth grant for the first and second parity births.

- **Eligibility conditions**

Families with the first and/or the second child born in the income reference year, subject to means-test.

- **Income test**

Families are entitled to the birth grant provided the family income (defined in the same way as net household income for child allowance) in the calendar quarter prior to the birth of the child did not exceed 2.7 times the family's Living Minimum (*Životní minimum*).

- **Benefit duration**

This is a lump sum benefit.

- **Benefit amount**

The amount of Birth Grant is CZK 13,000 for the first live born child and CZK 10,000 for the second live born child. If another live-born child/children is/are born together with this live-born child the total birth grant is 23,000 CZK.

- **Subject to taxes/SIC**

Exempt.

- **EUROMOD notes**

Income test modelled using income for the current year. Means-tested incomes are defined in the same way as in case of child allowance (bch00_s), but parental allowances are excluded from the income test (as income should refer to the calendar quarter before the birth of the first child). The assumption is made that children in the family are all siblings.

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

No changes.

2.4.6 Maternity Allowance (*Penežitá pomoc v mateřství*) - (bmact_cz)

• *Definitions*

This is a contributory benefit for the period of maternity leave, available to employees and insured self-employed persons. The benefit can also be claimed by the father of the child if he is a substitute carer. The benefit is paid to mothers/substitute careers of adopted/foster children, but we cannot simulate it for these categories due to the lack of data on adoption/foster status of children.

• *Eligibility conditions*

Giving birth or being a substitute carer (incl. fathers).

- At least 270 days of contributions during the 2 years preceding the take up of maternity benefit. For the self-employed: in addition at least 180 days of participation in sickness insurance during the year preceding the take up of maternity benefit. The period of study at secondary and higher education is also counted, but the study must be successfully completed. In case of the above-mentioned student, on the date of taking up maternity leave, the recipient must have income from work subject to sickness insurance.
- Loss of earnings for the period of leave (the woman must not have a paid position and may not run her own business).

• *Income test*

No.

• *Benefit duration*

The maternity leave begins 6-8 weeks before expected birth and lasts a total of 28 weeks, or 37 weeks in case of multiple births. The minimum duration is 14 months (if the child is stillborn).

• *Benefit amount*

The amount equals 70% of the Daily Assessment Base (*Denní vyměřovací základ*), paid during the period of maternity leave. Daily Assessment Base (DAB) is calculated using gross monthly earnings for employees and the contributory base of Social insurance and state employment policy contributions in case of self-employees, which are taken into account as follows:

- up to CZK 1,000: 100%
- CZK 1,000 to CZK 1,499: 60%
- CZK 1,499 to CZK 2,998: 30%
- earnings over CZK 2,998 are not taken into account.

Maximum amount: CZK 1,224 per day.

If a student receives income only for a short period of time (for example, less than a month) then the amount of Daily Assessment Base is calculated from his expected earnings.

The father of the child can claim maternity benefit but no earlier than the child is 6 weeks or older and only if the mother forfeits the benefit and leaves the childcare to the father. The amount of the maternity benefit of the father is calculated on the basis of his DAB in the same way as for the mother. The duration of the benefit is shortened by the amount of time the mother was in receipt of the benefit.

• *Subject to taxes/SIC*

Exempt.

- *Take up*

Nearly all mothers take maternity leave.

- *EUROMOD notes*

We assume that duration of maternity leave depends on the month of birth of a child. The month of birth is assumed to be equal to the middle month of the quarter of birth reported in SILC. If child's month of birth is unavailable, the assumption is that the child is born on February (2nd month of the year). Where mothers are absent, fathers are assumed to receive the allowance for the same number of weeks as mothers, hence in those families we might be overestimating the total amount of allowance.

As the benefit amount depends on the previous earnings, we assume those to be equal to the imputed wage (*yivwg*) or the current wage, whichever is higher. The imputed wage is recorded in hourly terms, hence we assume a country-specific standard number of hours worked per week (40 hours) and we recalculate *yivwg* in monthly terms ($yivwg * 40 * (52/12)$).

The simulation of this benefit is switched off in the baseline, i.e. the non-simulated component (*bmact*) is being used.

- *Changes in 2019*

The DAB is calculated using gross monthly earnings which are taken into account as follows:

- up to CZK 1,090: 100%
- CZK 1,090 to CZK 1,635: 60%
- CZK 1,635 to CZK 3,270: 30%
- earnings over CZK 3,270 are not taken into account.

Maximum amount: CZK 1,336 per day.

- *Changes in 2020*

The DAB is calculated using gross monthly earnings which are taken into account as follows:

- up to CZK 1,162: 100%
- CZK 1,162 to CZK 1,742: 60%
- CZK 1,742 to CZK 3,487: 30%
- earnings over CZK 3,487 are not taken into account.

Maximum amount: CZK 1,424 per day.

- *Changes in 2021*

The DAB is calculated using gross monthly earnings which are taken into account as follows:

- up to CZK 1,182: 100%
- CZK 1,182 to CZK 1,773: 60%
- CZK 1,773 to CZK 3,545: 30%
- earnings over CZK 3,545 are not taken into account.

Maximum amount: CZK 1,449 per day.

2.4.7 Paternity Allowance (*otcovská*) - (bpact_cz)

- **Definitions**

One-off benefit for fathers at the birth of a child introduced in 2018. The benefit can be taken within six weeks after the childbirth

- **Eligibility conditions**

The father has income from which sickness insurance is paid (wages and salaries, business activities). In case of income from business activities, the sickness insurance must be paid for at least three months.

- **Income test**

No.

- **Benefit duration**

One week.

- **Benefit amount**

The amount equals 70% of the Daily Assessment Base (the same system as in the case of Maternity allowance).

- **Subject to taxes/SIC**

Exempt.

- **EUROMOD notes**

As the benefit amount depends on the previous earnings, we assume those to be equal to the imputed wage (*yivwg*) or the current wage, whichever is higher. The imputed wage is recorded in hourly terms, hence we assume a country-specific standard number of hours worked per week (40 hours) and we recalculate *yivwg* in monthly terms ($yivwg * 40 * (52/12)$).

The simulation of this benefit is switched off in the baseline. However, the non-simulated component is still not available in EU-SILC 2017 which reflects incomes from 2016, as this policy was introduced in 2018.

- **Changes in 2021**

No changes.

2.4.8 Social Assistance Benefits (*Dávky v hmotné nouzi*) – (bsa_s)

Allowance for Living (bsa00_s)

- *Definitions*

Benefit for poor households.

- *Eligibility conditions*

A family and a dependent child are defined in the same way as for the housing benefit. The condition that the household must meet the costs of living together is always tested here. A temporary period spent outside the household for the purposes of work or training for future employment is allowed.

- *Income test*

Persons or families are entitled to an allowance for living if the income of these persons or families is less than the amount of living when “reasonable” housing costs have been deducted. Amount of living is equal (in “standard” situation) to the sum of MLS.

If an adult person is without work more than 6 months and not seeking actively a job, the minimum living standard for social assistance is just subsistence minimum, instead of Subsistence minimum + 0.4*(minimum living standard - subsistence minimum). This does not apply to pensioners, sick persons and people who are participating in public works.

The net household income for the purpose of testing eligibility for the benefits is defined as 70% of work and other taxable income (net income) + 80 % of unemployment benefits, sickness benefits and pensions + 100 % of other income but without tax bonus and housing benefit.

- *Benefit duration*

No time restriction.

- *Benefit amount*

The amount of the allowance for living is set as the difference between the amount of living of a person or family and the income of that person or family, less reasonable housing costs. (Reasonable housing costs are the cost of housing to a maximum of 30%, in Prague 35%, of the income of the person or family).

- *Subject to taxes/SIC*

Exempt.

- *EUROMOD notes:*

In EUROMOD Individuals in “material need”, i.e. having an assessed income lower than the minimum living standard (MLS), are assumed to be registered as job seekers with the Labour Office. However, only those working or seeking actively a job over the past for weeks are entitled to a higher minimum living standard than the subsistence minimum.

- *Changes in 2019*

No changes.

- *Changes in 2020*

No changes.

- *Changes in 2021*

No changes.

Supplement for Housing (bsaho_s)

- *Definitions*

Benefit for poor households, which are burdened with high housing costs.

- *Eligibility conditions*

Persons of the same domicile address are considered in the same unit of assessment, without having to be a member of one household.

- *Income test*

Net household income, including housing benefit and social assistance benefit and after paying housing costs (at most the normative costs) is still lower than the MLS. Their income is then topped up to the MLS on the assumption that the individual actively seeks a job.

If the persons live in lodging house the maximum amount of housing costs is 75% of normative costs. Lodging houses are buildings mostly containing very poorly furnished rooms with shared bathrooms.

- *Benefit duration*

No time restriction.

- *Benefit amount*

The difference between the housing costs reduced by the amount of housing benefit and net income increased by living allowance and reduces by the amount of minimum living standard for social assistance.

- *Subject to taxes/SIC*

Exempt.

- *Changes in 2019*

No changes.

- *Changes in 2020*

No changes.

- *Changes in 2021*

No changes.

2.5 Social contributions

The social contributions in Czechia can be divided into two parts:

- Social insurance and state employment policy contributions consist of pension insurance, contributions for the state employment policy and sickness insurance.
- Contributions for public health insurance

2.5.1 Employee social contributions

Social insurance and state employment policy contributions

The contributory base for employee is the gross wage plus any bonuses, standby-duty remuneration, etc. of the employee, but not income which is not subject to income taxation, income from occasional work, compensations, rewards for increased productivity, etc. A maximum contributory base was introduced in 2008.

Table 16: Maximum contributory bases in 2018-2021 (in CZK per year)

<i>Max base for:</i>	<i>2018</i>	<i>2019</i>	<i>2020</i>	<i>2021</i>
Soc. insurance and state employment policy contributions	1 438 992	1 569 552	1 672 080	1 701 168

Notes: Applied for both for income from employment and business activities. If the person has both types of income (job and business), the contribution bases are summed.

Contributions for Public Health Insurance

The contributory base is the same as in Social insurance and state employment policy contributions. But there is a minimum contributory base, which is equal to minimum wage (it is not applied, if the person uses the minimum contributory base as self-employed). For those who do not have permanent income such as students, pensioners, children, the state pay minimum insurance, therefore the minimum contributory base is not relevant in these cases. There is no maximum contributory base. Information on the contribution rates is provided below.

Contribution rates in 2018-2019:

	<i>Employee</i>	<i>Employer (per employee)</i>	<i>Entrepreneur</i>
Social Insurance	6.5%	25.0%	29.2%
Of which: Pension	6.5%	21.5%	28.0%
Unemployment	n/a	1.2%	1.2%
Sickness	n/a	2.3%	2.3%*
Health Insurance	4.5%	9.0%	13.5%
Total	11.0%	34.0%	45.0%

Note: * paid on a voluntary basis.

• **Other changes in 2019**

From 1 July 2019, the rate of sickness insurance will change from 2.3% to 2.1%. As policies simulated in EUROMOD are those of June 30, this change is out of 2019 implementation. Moreover, the within-year policy change is not significant enough to be simulated using a “Full Year Adjustment” policy switch.

• **Changes in 2020**

The rate of sickness insurance has been changed from 2.3% to 2.1%.

Table 17: Contribution rates in 2020 and 2021:

	<i>Employee</i>	<i>Employer (per employee)</i>	Entrepreneur
Social Insurance	6.5%	24.8%	29.2%
Of which: Pension	6.5%	21.5%	28.0%
Unemployment	n/a	1.2%	1.2%
Sickness	n/a	2.1%	2.1%*
Health Insurance	4.5%	9.0%	13.5%
Total	11.0%	33.8%	44.8%

Note: * paid on a voluntary basis.

- ***Changes in 2021***

No changes.

2.5.2 Employer social contributions

Social insurance and state employment policy contributions

Contributory base is the same as in the case of employee. Information on the contribution rates and maximum bases provided in section 2.5.1.

Contributions for Public Health Insurance

Contributory base is the same as in the case of employee. Information on the contribution rates and maximum bases provided in section 2.5.1.

- ***Changes in 2019***

New amount for Social insurance and state employment policy contribution base (see section 2.5.1).

- ***Changes in 2020***

New amount for Social insurance and state employment policy contribution base (see section 2.5.1).

- ***Changes in 2021***

New amount for Social insurance and state employment policy contribution base (see section 2.5.1).

2.5.3 Self-employed social contributions

Social insurance and state employment policy contributions

Entrepreneurs pay pension insurance and contributions for the state employment policy, while sickness insurance is paid on a voluntary basis. For entrepreneurs it is important, if the business activity is the main source of income or not. Since 2012 the business activity is the main source of income, if the monthly income from wages and salaries is lower than 2,500 CZK (3,000 CZK since 2019). Income from business activity is minor source of income as well, if the person is student (and the age is lower or equal to 26) or pensioner. If the person has both types of income (job and business), the contribution bases are summed.

a) If income from business activity is the main source of income

- For entrepreneurs, the base is 50 % of net income (gross income minus costs) in the last year, but not more than the maximum contribution base (see table in section 2.5.1).

Table 18: Annual minimum contribution base (in CZK per year):

<i>2018</i>	<i>2019</i>	<i>2020</i>	<i>2021</i>
89,940	98,100	104,508	106,332

b) If income from business activity is the minor source of income

- If the year gross income minus costs is lower than amount defined in the table below, there is no obligation to pay social insurance. In other cases the participation in the social insurance is compulsory and the contribution base is 50% of net income in the last year, but not more than the maximum contribution base (see table in section 2.5.1).

Table 19: The threshold for the mandatory payment of insurance if the business activity is the minor source of income

<i>2018</i>	<i>2019</i>	<i>2020</i>	<i>2021</i>
71,950	78,478	83,604	85,058

Contributions for public health insurance

For entrepreneurs, the base is 50% of net income in the last year, but not more than the maximum contribution base (see table in section 2.5.1).

If the income from business activity is the main source of income, the annual contribution base cannot be lower than the amount defined in the table.

Table 20: Minimum contribution (in CZK per year):

<i>2018</i>	<i>2019</i>	<i>2020</i>	<i>2021</i>
179,880	196,200	209,016	212,646

If the person has both types of income (job and business), the contribution bases are summed.

The maximum contribution bases for both types of contributions are updated annually and are the same as in case of employees. See table in Section 2.5.1 for details.

- ***Other changes in 2019***

No changes.

- ***Other changes in 2020***

As response to the COVID-19 pandemic, a reduction of social and health insurance contribution for self-employed persons by 50 % of contribution calculated from the minimum contribution bases was put in place.

- ***Other changes in 2021***

No changes.

2.5.4 Credited insurance contributions

For those who do not have permanent income such as students, pensioners, children, unemployed registered at the labour offices and social assistance beneficiaries the state pays minimum insurance to health insurance companies. State minimum insurance is calculated as a multiple of the contributory base for state-insured and rate 13.5%. The value of the contributory base is determined by government decree. These amounts (per month) were: since 1/2017 CZK 6,814; since 1/2018 CZK 7,177; since 1/2019 CZK 7,540; since 1/2020 CZK 7,903; since 6/2020 CZK 11,607 and since 1/2021 CZK 14,600.

- **EUROMOD notes:**

In EUROMOD all social assistance beneficiaries are assumed to be registered as job seekers with the Labour Office.

2.6 Personal income tax

2.6.1 Tax unit

Personal income tax is paid by any person who has residence or lives in Czechia for at least 183 days in a year. Taxable income includes all income earned in Czechia and abroad. If a person lives in Czechia for the purpose of study or recuperation or less than 183 days in a year, the taxable income is only the income from Czechia.

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

No changes.

2.6.2 Exemptions

The tax base does not include income from selling one's own house or flat if a person has lived there for at least two years before the transfer, and if the house or flat was not used for business purposes, or if the time between buying and selling the house or flat was more than five years⁵. Nor does it include loans and drafts, income from property insurance, sickness benefits, state social support, social assistance, unemployment benefit, income from public health insurance, the amount of pensions lower than 36 * minimum wage per year, maintenance paid to soldiers, stipends, donations from the state budget, tax bonuses, benefactions, alimony, travel expenses paid by employers, meals or beverages provided by employers, complementary pension insurance with the state support or private life insurance paid by employers up to 30,000 CZK (since 2017 50,000), winnings in state lotteries, income from appreciation of currency, and income taxed according to a separate tax scheme.

- **Changes in 2019**

No changes.

⁵ Furthermore, the tax base does not include income from selling chattels with the exception of personal vehicles, ships and aeroplanes, provided that the time between buying and selling these items was less than one year.

- **Changes in 2020**

No changes.

- **Changes in 2021**

No changes.

2.6.3 Tax allowances

Taxpayers may deduct the following allowances from their tax base (in CZK per year):

- *Gifts to charitable organisations* may be deducted if the amount of the gift is at least 2% of the tax base or 1,000, and if the charity is recognised by the state. The taxpayer may deduct at most 15 % of the tax base.
- *Interest used for mortgage repayments*. The maximum limit is 300,000 CZK per household.
- *Complementary pension insurance with state support*. The total deductible amount is the sum of all payments to complementary pension funds less 12,000.
- *Private life insurance*. The taxpayer must be insured for at least five years, and must be under 60. The minimum amount of insurance premium is 40,000 if the duration of insurance is between 5 and 15 years, and 70,000 if the duration is more than 15 years.
 - The maximum total deductible amount for the sum of the payment for *Complementary pension insurance with state support* and *Private life insurance* is 24,000.
- *Labour union fees*. The taxpayer may deduct fees paid to labour unions. The maximum amount is either 1.5% of the taxable income or 3,000.

- **EUROMOD notes:**

Due to lack of data some of the above mentioned tax allowances are not activated in the model. Only the tax allowances on *interests used for mortgage repayments* and on *complementary pension insurance* are simulated.

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

No changes.

2.6.4 Tax base

The tax base for personal income tax is divided into five partial tax bases:

1. super gross wages and salaries, since 2008 (i.e. increased by social insurance contributions paid by the employer);
2. income from business activities including income from agriculture, forestry and fishery; income from copyright;
3. capital income including dividends, interest, revenues from expiration of contract of complementary pension insurance with state support; income from life insurance (minus premium paid); income from options and forwards;
4. rental income;

5. and other income.

Wages and Salaries

If the amount of wages and salaries is less than 10,000 CZK per month and the character of the job is occasional, it is taxed by a separate tax rate (15 %).

Since 2008 the social and health insurance contribution paid by employer is a part of the partial tax base of “Wages and salaries”.

EUROMOD notes: due to lack of information in the data about occasional jobs, EUROMOD simulations don't include this special rate for low wages and salaries.

Income from business activities

Entrepreneurs may account for losses in order to reduce their profit, but only in the case of the same activity. For entrepreneurs, taxable income is also net of costs (social and health insurance contribution is not tax deductible item). Instead of deducting the amount of actual costs, a taxpayer may replace it by 80% of revenues from agriculture, forestry, fishery and craft, 60 % of revenues of non-craft activities, 40% of revenues of copyright or 30% of rental revenues. However, the maximum amount of costs calculated as the % of revenue is set at 800,000 CZK (for 80 %), 600,000 CZK (for 60 %), 400,000 CZK (for 40 %) and 300,000 CZK (for 30 %).

If the entrepreneur's spouse helps the entrepreneur with his or her business, the taxable income from this partnership is divided such that the partner may have taxable income of at most 50% or 540,000 CZK per year (or 45,000 CZK for each month of the business partnership) of the total taxable income of the married couple. If more persons live with an entrepreneur in the same household and help him or her with his business, the taxable income is then divided so that the entrepreneur's partners may have at most 30% or 180,000 CZK per year (or 15,000 per month) of total taxable income. If a child in the household is a business partner, the parents are not eligible for a tax allowance per child or for a tax bonus per child. Children in compulsory schooling may not be made partners.

Honorariums of less than 10,000 CZK per month from newspaper articles are taxed at a separate tax rate (15 %).

EUROMOD notes: due to lack of information in the data we taxed this type of income as a part of the tax base.

- **Changes in 2019**

The maximum amount of such costs is set at 1,600,000 CZK (for 80 %), 1,200,000 CZK (for 60 %), 800,000 CZK (for 40 %) and 600,000 CZK (for 30 %).

- **Changes in 2020**

No changes.

- **Changes in 2021**

The first partial tax base was modified. It no longer includes social security contributions paid by the employer.

Capital income

Almost all incomes are taxes by the separate tax rate (15 %).

Rental income

The taxable income is net of costs.

Other income

Other income includes income from occasional activities exceeding 30,000 CZK per year, income from the transfer of own real estate (with exemptions described below), nourishments, pensions exceeding 36 * minimum wage per year, winnings in lotteries exceeding 10,000 CZK.

The total tax base is the sum of the five partial tax bases mentioned above. The total tax base cannot be lower than the partial tax base "wages and salaries".

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

No changes.

2.6.5 Tax schedule

There is one rate for all types of income – 15 %.

Moreover, if the income from Wages and Salaries and from business activities exceeds the maximum contributory base for social insurance and state employment policy contributions, the income, which is above this amount, is taxed by addition tax rate 7 %. In this case income from Wages and Salaries is possible to reduce by loss from business activities.

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

Existing tax schedule (15 % basic rate and 7% for earnings and self-employment incomes above the max contributory insurance) was abolished.

New progressive tax schedule was introduced with two marginal rates - 15 and 23%. The boundary between tax brackets is set at the level of the maximum contributory base of social security contribution.

2.6.6 Tax credits

2.6.6.1 “Standard” tax credits:

Table 21: Personal tax credit for each taxpayer (in CZK per year):

<i>2018</i>	<i>2019</i>	<i>2020</i>	<i>2021</i>
24,840	24,840	24,840	27,840

- *Spouse tax credit* (24,840 CZK) applies if a spouse lives with the taxpayer in the same household and does not have a yearly income higher than 68,000 CZK. The income of the spouse tested for this purpose is generally in gross terms. It does not

include disability pension, state social support, social care benefits, state support for complementary pension insurance, state support for savings for building purposes, or stipends. The tax credit doubles (49,680 CZK) if the spouse is disabled.

- *Disability tax credit* is divided into 3 levels: 1) Disability 1st level – tax credit 2,510 CZK per year; 2) Disability 2nd level – tax credit 2,510 CZK per year and 3) disability 3rd level tax credit 5,040 CZK per year.
- *Student tax credit* (4,020 CZK) may be applied if the taxpayer is less than 26 and is an undergraduate student, or when he/she is a graduate student and is less than 28.
- The tax credit compensating the cost of placing a child in kindergarten has been introduced. Its amount depends on the payment for kindergarten. Maximum amount of this credit is equal to minimum wage.

EUROMOD notes: Due to lack of data about the kindergarten costs, the corresponding tax credit is not simulated. Besides, when modelling the disability tax credit, partial disability is assumed for all recipients due to lack of information on disability level.

- **Changes in 2019**

No changes.

- **Changes in 2020**

No changes.

- **Changes in 2021**

Personal tax credit was increased from 24,840 CZK/year to 27,840 CZK/year.

2.6.6.2 Refundable child tax credit

Persons, who care for dependent children, may deduct (after the use of standard credits) from their income tax a tax credit per child. A child or children must live in the same household as the parents (or may alternatively be temporarily placed in institutions for the purpose of study or preparation for future work). Persons are eligible for the credit each month in which the conditions are met.

Table 22: The amount of the refundable child tax credit (in CZK per child per year)

2018	2019	2020	2021
15,204 *	15,204 *	15,204 *	15,204 *
19,004**	19,004**	19,004**	19,004**
24,204***	24,204***	24,204***	24,204***

* first child, ** second child, *** third and other children

If the tax duty is lower than the tax credit, the difference is called a tax bonus and is paid to the taxpayer, while the taxpayer's tax duty is then zero. The tax bonus is paid just in the case that the sum of income from Wages and Salaries and from business activities of the person is higher than 6 times the minimum wage per year. The maximum amount of tax bonus is 60,300 CZK per year. If the tax duty is higher than the tax credit, the taxpayer pays the difference between the two. Only one parent can claim the refundable child tax credit.

A dependent child for the purposes of tax allowance or bonuses is defined as an own child, adopted child, child in foster care, children of one's spouse and grandchildren if they are younger than 18, or younger than 26 if not receiving full invalidity pension and currently preparing for future employment. A child who cannot prepare for future employment because of injury, long-term illness or disability that prevents work is also considered a dependent.

- *Changes in 2019*

No changes.

- *Changes in 2020*

No changes.

- *Changes in 2021*

The limit of the maximum amount of the tax bonus was cancelled.

2.7 COVID-19 related policy measures

2.7.1 Compensation Bonus for self-employed (*Kompenzační bonus*) – (ysecomp_cz)

- *Definitions*

Compensation Bonus is a direct cash support for self-employed persons in the amount of CZK 500 per day that was put in place as result of the COVID-19 pandemic.

EUROMOD notes: this policy can only produce results if the model is run in combination with the LMA add-on. The individuals that are selected to undergo transitions to monetary compensation schemes are defined in the TransLMA_sk policy, which is switched on automatically by the add-on. For more information about the modelling of labour market transitions, please consult the “Simulating labour market transitions in EUROMOD” document.

- *Eligibility conditions*

This benefit will be paid if the following conditions are met:

- the activity performed is the principal activity,
- self-employed person declares that he/she has not been able to perform this activity in whole or in part above the usual level, due to health threats related to the occurrence of COVID-19 or government crisis measures.

EUROMOD notes: eligibility is based on a random allocation of individuals to this scheme. Labour transition model based data are produced by Eurostat, using detailed distributional information on the loss of jobs and short-term work schemes from the Labour Force Survey and administrative data. The impact across different categories of individuals, the duration of unemployment/absence and percentage of hours worked are modelled using the EU-LFS longitudinal and quarterly transitions as target. For more information please consult the methodological note available at [9a70fb55-ceb7-d25a-1b31-ab0c030095d2 \(europa.eu\)](https://ec.europa.eu/eurostat/tgm/table.do?tab=table&init=1&language=en&plugin=1). 2021 statistics on labour transitions are not yet available and, therefore, the simulation of the scheme for 2021 is not triggered. Nevertheless, alternative shares can be simulated by adjusting the parameters of policy TransLMA_cz

- *Benefit duration*

The first period for which it is paid is March 12 to June 8, i.e. around 3 months. The second period is October 5 to December 31 (i.e. around 3 months). In 2021 the benefit was extended until the end of May (5 additional months)

EUROMOD notes: in cases for which the duration of the benefit is higher than the individuals' number of months in self-employment, the latter works as an upper limit for the total duration. The maximum duration simulated in the model is of 6 months in 2020 (5 months in 2021), including both periods for which the benefit was provided.

- **Benefit amount**

The benefit amount is of CZK 500 per day (CZK 1,000 after January 2021), up to a maximum amount of CZK 89,000, which approximately corresponds to the maximum amount for 6 months.

EUROMOD notes: In 2021 only the benefit amount of CZK 1,000 per day is simulated, although during January 2021 the previous scheme, whose amount was of CZK 500 per day, was in place.

- **Subject to taxes/SIC**

Exempt.

The income from the compensation bonus enters the decisive income for social assistance benefits.

- **Take up**

Once individuals have been randomly allocated to this scheme, full take-up is assumed.

- **Changes in 2021**

The current regulation was valid until 31 January. After that, the value of the bonus was increased to CZK 1,000 per day. The new system was approved with effect until the end of May.

2.7.2 Wage compensation scheme (*Programme Antivirus*) – (yemcomp_cz)

- **Definitions**

The programme Antivirus is targeted at employers, whose businesses are affected by the COVID-19 pandemic.

EUROMOD notes: this policy can only produce results if the model is run in combination with the LMA add-on. The individuals that are selected to undergo transitions to monetary compensation schemes are defined in the TransLMA_sk policy, which is switched on automatically by the add-on. For more information about the modelling of labour market transitions, please consult the “Simulating labour market transitions in EUROMOD” document.

- **Eligibility conditions**

Employers whose economic activity is at risk due to spread of the infection will be granted a contribution to reimburse, in whole or in part, the wage compensations to employees. The obstacles to perform the economic activity depend on whether they are due to an obstacle on the part of employees (quarantine) or on the part of employers (closure of business due to the Government order to close business operation).

EUROMOD notes: eligibility is based on a random allocation of individuals to this scheme. Labour transition model based data are produced by Eurostat, using detailed distributional information on the loss of jobs and short-term work schemes from the Labour Force Survey and administrative data. The impact across different categories of individuals, the duration of unemployment/absence and percentage of hours worked are modelled using the EU-LFS longitudinal and quarterly transitions as target. For more information please consult the methodological note available at [9a70fb55-ceb7-d25a-1b31-ab0c030095d2 \(europa.eu\)](https://ec.europa.eu/eurostat/tgm/table.do?tab=table&init=1&language=en&plugin=1). 2021 statistics on labour transitions are not yet available and, therefore, the simulation of the scheme for 2021 is not triggered. Nevertheless, alternative shares can be simulated by adjusting the parameters of policy TransLMA_cz

• *Benefit duration*

The maximum simulated duration of the benefit is of 9 months, from April 1 to December 31. In 2021 the benefit was extended until the end of June (6 additional months).

EUROMOD notes: in cases for which the duration of the benefit is higher than the individuals' number of months in employment, the latter works as an upper limit for the total duration.

• *Benefit amount*

The amount and duration of the provision will depend on the reason for the occurrence of an obstacle at work; for each employee it will be necessary to distinguish the reason for the obstacle to work. The amount of compensation to employers is derived from the average super-gross wage, including compulsory contributions (CZK 48,400), and depends on the reasons for the obstacle to work.

There are two regimes:

Regime A — type of obstacle:

- In the event of ordered quarantine, the employee receives a wage compensation amounting to 60 % of the reduced average earnings
- In the event of closure of business due to the Government order the employee receives a wage compensation of 100 % of the average earnings.

The employer's contribution amounts to 80% of the compensation paid, but a maximum of CZK 39,000.

Regime B — type of obstacle:

- Obstacles to work on the part of an employer due to the ordered quarantine or childcare for a significant proportion of employees (30 % or more) — the employee receives a wage compensation of 100% of the average earnings
- Limitation of the availability of inputs (raw materials, products, services) necessary for the activity — the employee receives a wage compensation amounting to 80 % of the average earnings
- Reduced demand for services, products and other products of the company — the employee receives a wage compensation amounting to 60 % of the average earnings

The employer's contribution amounts to 60% of the compensation paid, but a maximum of CZK 29,000.

EUROMOD notes: out of the share of workers assumed to transit to wage compensation, beneficiaries are then randomly allocated to each regime as follows:

<i>Regime</i>	<i>Type of obstacle to work</i>	<i>Share</i>
Regime A	1 st obstacle: quarantine (employee)	20%
	2 nd obstacle: closure of business	20%
Regime B	1 st obstacle: quarantine	20%
	2 nd obstacle: quarantine	20%
	3 rd obstacle: quarantine	20%

• *Subject to taxes/SIC*

Yes, except those workers under Regime A, 1st obstacle.

Included in other benefits' means-test.

- *Take up*

Once individuals have been randomly allocated to this scheme, full take-up is assumed.

- *Changes in 2021*

Regimes A and B continue until the end of June.

2.7.3 One-off bonus for pensioners – (pecls_cz)

- *Definitions*

One-off bonus of CZK 5,000 for any recipient of old-age, disability or widow's/widower's pensions.

- *Eligibility conditions*

Being currently receiving any old-age, disability or widow's/widower's pensions.

- *Benefit duration*

One-off benefit to be received in December 2020.

- *Benefit amount*

Lump sum of CZK 5,000.

- *Subject to taxes/SIC*

Similar fiscal treatment as other pensions.

- *Changes in 2021*

This benefit is not approved for this year.

3. DATA⁶

3.1 General description

Table 23: EUROMOD database description

EUROMOD database	CZ_2019_b1
Original name	EMSD (EU-SILC and <i>Životní podmínky</i> (SILC) 2019)
Provider	Eurostat and Czech Statistical office (CSO)
Year of collection	2019
Period of collection	February 3 to May 27 2018
Income reference period	Year 2018
Sampling	Two stage random sampling
Unit of assessment	HH [1]
Coverage	Private households [2]
Sample size	19 150 IND (out of it 22 children born after reference period dropped) 8 707 HH (response), 2 188 (non response)
Response rate	79,9%

Notes:

[1] One person living alone or a group of people living at the same apartment (address) **and** sharing expenditures (housekeeping concept). If more than one household was found in a dwelling unit, all HH in selected dwellings were included as eligible for the survey.

[2] Households living at private residential addresses.

This description of the Czech SILC 2019 survey is mostly based on more detailed methodological notes provided by the CSO.⁷ SILC survey is a survey introduced in Czechia following Eurostat guidelines and it added to already existing surveys, namely quarterly rotating panel of Labour Force Survey (VŠPS in Czech) and annual Household Budget Surveys. First survey was run in 2006 (SILC 2005).

The SILC survey is regarded as a multipurpose source. Data have been used for several official and unofficial income distribution analyses and for tax/benefit modelling. SILC is the only suitable survey available for EUROMOD purposes thanks to its annual frequency and information on both labour statuses and incomes. The survey was carried out in all regions of Czechia. The fieldwork revealed that among the total of 11 553 dwellings in the sample there were 692 (6 %) dwellings either unoccupied, or the address did not exist or the survey was not possible, e.g. because the households had moved. Since substitution for the ineligible units is not allowed, the survey was conducted in 10 861 dwellings and 10 895 households (there was more than one household in some of the dwellings).

The survey was carried out in all regions of the Czech Republic. The interviewers visited 6 684 dwellings whose questionnaires were completed in the previous year, 119 dwellings where a sample person from the previous wave moved to and 4 750 newly selected dwellings.

The sample was obtained by applying a two-stage probability sampling scheme to each of the 14 administrative regions (NUTS3 regions) independently. The total number of dwellings selected in each region was proportional to the region's size. At the first sampling stage small geographical areas (CEUs - census enumeration units or districts) were selected by probability

⁶ Information provided in this section has been distilled from the description by the CSO, accompanying the national version of the SILC 2018 database. Internet: <https://www.czso.cz/csu/czso/household-income-and-living-conditions-2019>

⁷ Internet: <https://www.czso.cz/csu/czso/household-income-and-living-conditions-8up5xmeg71>

sampling. These CEUs served as a basis for the second-stage selection (a sample of 10 dwellings was drawn from each CEU).

Before selecting the sample of dwellings, the sampling frame had to be adjusted to enable incorporation of small census enumeration units into the sampling process to reach the required full geographical coverage of the national territory. Small CEUs (with less than 20 inhabited dwellings) were merged with adjacent CEUs and the resulting larger CEUs entered the first stage of sampling. Therefore, in some cases, the 10 chosen dwellings could belong to two or more (in exceptional cases) CEUs.

The CZSO's regional fieldwork units (each covering one of the 14 NUTS3 administrative regions) received the list of selected dwellings (addresses + identification numbers of flats in apartment buildings). Before the actual fieldwork, the regional fieldwork units' staff carried out the identification of the selected dwellings and filled in the contact names on the list of selected dwellings for interviewers.

The sampling unit is a dwelling. During the first-wave visit all households and all the persons who have the dwelling as their main place of residence are surveyed. This rule also applies to foreign nationals and subtenants. During the waves 2-4 only those households are surveyed which include a panel person (those surveyed in the 1st wave). Panel persons who moved from the original households are followed up. At their new address, all persons who are members of the same household as the panel person are surveyed.

Methods of acquiring data were carried out by dual scheme. A predominant part of the selected households was interviewed with an electronic questionnaire (CAPI); a part was interviewed using paper questionnaires (PAPI).

Data collection lasted from February 2 to May 26 2019. Collection of data was coordinated by workers from regional departments responsible for fieldwork. Workers from regional departments also conducted methodical training of fieldworkers.

The primary database used for the EUROMOD microsimulation model is the Eurostat UDB SILC for Czechia. Since numerous variables are needed in greater disaggregation, these were added from the SILC database provided directly by the CSO (it contains variables defined differently from the Eurostat UDB). Eurostat merged together these two files, and already imputed some EUROMOD variables because of restricted data access or knowledge in-house. In this regard, the derivation of some EUROMOD variables draws from the PDB SILC, which contains more precise information. The combination of UDB, national SILC and EUROMOD variables imputed inside Eurostat represents the EMSD database. The EMSD has been used as the main data source to derive the EUROMOD input data (see subsection 3.1.1). In particular, the following variables are being used from the Czech SILC database (Czech acronyms in brackets)⁸:

- dmp (vel) – population size of residential unit to account for different housing allowance;
- bch00 (privad) – child allowances (*Přidavky na děti*);
- bchba (imputed from UDB (HY053) and CZ-SILC (pridav)) – Birth Grant (*Porodné*);
- bfapl (rodpl) - Parental Allowances (*rodičovský příspěvek*);
- bfafp (pestp) - Foster Care Benefits (*dávky pěstounské péče*);
- tin (dan) – Income Tax at personal level (*daň z příjmů fyzických osob*);
- tscee (pojís) - Health and social insurance contribution of employee at individual level (*zdravotní a sociální pojistné odvody zaměstnance*);

⁸ Variables are reported at household level if not stated otherwise.

- cz_pensiontype (dduch) - Czech system types of pensions (*druh důchodu*);
- cz_pensiont (duch) - Total amount received in pension benefits according to Czech types in cz_pensiontype (dduch).

Size of the household - the number of household members on the date of the interview, including persons temporarily away, if the period of actual or foreseen absence is shorter than 6 months and the person has no other private address. For persons studying away from home, the period of absence may be longer than 6 months, provided that the person has no private address and retains financial ties to other household members. Persons with a period of absence longer than 6 months, persons without financial ties to the household and persons temporarily present at the time of the interview who have their private address elsewhere are excluded.

Sample quality and weights

Non-response

Participation in the sample survey is voluntary; unlike the population census, households were not obliged to provide any information. A selected household has to be informed about the content of the survey and about the fact that their participation in the survey is voluntary. Whether to respond or not is left to the household's own deliberation. The main reasons for refusal are privacy reasons (objections against giving personal information and fear of abuse of personal data), fear of contact with interviewers as strangers. There is a considerable group of persons, who as a matter of principle strictly refuse to give any information.

Weights

When compared with the data from other statistics and registers, selected characteristics of our sample showed that a phenomenon typical of household surveys had occurred - high level of non-response (in a rotational panel influenced by a prior response) had biased the proportions in the final data file from which results are obtained. The deformation of demographic characteristics and social structure of the sample did not allow us to use simple techniques of grossing up (post-stratification). To reach a sufficient level of bias elimination, which is the necessary pre-condition for obtaining good estimates, it was necessary to use more sophisticated methods.

In practice, the well-tried iteration method of weight calibration was utilized, which minimizes the difference between the known and the grossed-up values of selected characteristics. Although it is a panel survey comprising data of four practically independent samples (waves 1-4), a simple calibration method was utilized which did not distinguish the waves but worked with all households together.

At the same time and according to the Eurostat's recommendations the standard system of integrated weights was used in the survey, i.e. a single set of grossing-up coefficients that was subsequently used to produce results for both households and individuals.

As the basis for calculations the following calibration variables were used:

- Population characteristics:
- Population totals in each NUTS3 region (from demographic statistics)
- Economic activity characteristics in each NUTS3 region
 - Number of employees – derived from the number of employees in the economy based on the Labour Force Survey (LFS) results and company reporting
- Economic activity characteristics in each NUTS3 region:

EUROMOD Country Report – CZECHIA

- Number of pensioners (excl. pensions for orphans) - based on the administrative data from the MPSV and the Czech Social Security Administration and reduced the pensioners living out of the dwellings based on the 2011 Census
- Number of unemployed - registered unemployment from the administrative source of the MPSV, corrected for unregistered unemployment using the Labour Force Survey data and for unemployment of the homeless and persons living in institutions or collective accommodation establishments (based on the 2011 Census)
- Number of recipients of parental allowance – data from MPSV for 2018
- Number of self-employed - estimate based on the Labour Force Survey and on the administrative data from the Czech Social Security Administration
- Number of children aged 0-15 - from demographic statistics
- Demographic characteristics in each NUTS3 region (based on the demographic statistics):
 - Age groups (0-15, 16-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75+); Sex
- Municipality size (less than 2 000 inhabitants, 2 000-9 999, 10 000-49 999, 50 000 or more inhabitants)

The target population of the survey was persons living in private households, therefore the data from demographic statistics was adjusted by subtracting institutionalized population (from social security administrative data and Ministry of Justice) and the persons living outside dwellings as based on the 2011 Census.

As the sampling unit is the dwelling, all weight coefficients were calculated for dwellings and subsequently assigned to all persons and households in them (integrated weights).

The method described above deals with non-response successfully, i.e. it corrects the bias due to the specific composition of households that did not respond. First of all, it improves demographic and social structure but, as a by-product, it also eliminates deformation of income indicators related to these structures.

Table 24: Descriptive Statistics of the Grossing-up weight

Number	2005	2007	2008	2010	2012	2015	2016	2017	2018	2019
Mean	569.94	442.07	379.86	486.59	508.59	582.53	545.04	539.24	547.98	543.90
Median	520.55	396.13	337.54	446.56	469.51	532.76	492.55	485.52	499.88	488.35
Maximum	2600	3475	2875	1846	1695	2048	1716	2190	2315	1974
Minimum	100	100	100	129	144	164	195	226	210	171

Decile 1	312.38	243.51	204.16	143.06	289.65	333.85	314.91	312.79	213.54	269.53
Decile 9	874.80	683.29	599.44	755.93	758.36	872.40	819.44	805.96	812.15	895.37
Dec 9 / Dec1	2.80	2.81	2.94	5.28	2.61	2.61	2.60	2.57	3,80	3.32

Item non-response and under-reporting

Another source of bias, to be taken into account, stems from the method of interviewing. Data on income and housing costs obtained during face-to-face interviews with household members has the tendency to underestimate or overestimated, certain income sources or data on some income components can be completely missing (item non-response). Not to reduce the size of the processed dataset the missing income was imputed using correct statistical methods.

In SILC 2019 the interviewer failed to obtain income information for one person in an otherwise successfully interviewed household only in 19 cases. The missing income of such individuals

was replaced with income of another randomly selected person with the same characteristics, i.e. a simple hot-deck method was applied.

Underestimation of income is a natural consequence of the fact that respondents either tend to state lower than actual values or simply do not recall having had certain irregular or small incomes at all. It is, more or less, a non-sampling error, affected substantially by the incomes themselves and by their source. The possibilities to eliminate this underestimation are limited. In the presented survey, only such adjustments were made where there was a sufficiently reliable external statistical source or where the conjectures could be based on legislation.

If the respondent reports income from employment as net, the net income often shows a significant tendency to be distorted (either under- or overestimated) and the non-sampling error grows. This might occur when the employer deducts a certain amount from the employee's wage/salary (e.g. alimonies or pension scheme contributions). When calculating the gross income, this bias is usually adequately compensated for by using additional information from the survey. The level of gross income from employment was compared with the results of wage statistics and for persons who were revisited and stayed in their former jobs with data from the previous waves. Some respondents mistakenly reported gross income as net or vice versa and thus there were significant and inexplicable year-to-year differences. In such cases top-bottom coding was applied or the data were edited. With the self-employed no income corrections were necessary.

In case of social benefits with legal entitlement (parental leave, child birth benefit, death grant provided to families of the deceased, to some extent also maternity leave), a check on their receipt by eligible households was applied and amounts provided were corrected according to the amounts set by the legislation. With old age benefits (pensions from the social security system) the tendency to underestimation is negligible but as there were falls or increases in this kind of income without any outward reason, the amounts were corrected according to the last year's values.

It was not possible to correct the underestimation of sickness benefits (omissions related to short-term illnesses could not be identified in the existing data), means-tested social benefits whose claims depend on the previous income (prior to the income reference period), capital income, or income in kind and inter-household transfers.

The comparison of the aggregated income from this survey with the household sector aggregates of the national accounts (even after subtraction of items which are not covered by household income surveys) is problematic. Concerning its aggregated value the income obtained by direct questioning in households will always be lower. More important fact for evaluation of their credibility is that the trend in the development of household income follows trends in the national accounts. From this viewpoint, the presented results of Living Conditions 2019 are reliable and, as to their time series, consistent. They are fully comparable with similar statistics produced in the EU states.

3.1.1. EUROMOD SILC Database (EMSD)

From 2021 onwards, a new database prepared by Eurostat - EUROMOD SILC database (EMSD) is used to derive the EUROMOD input dataset. The EMSD includes:

- all UDB (User Database) variables (each variable is described in the doc 65 available online);
- national SILC data supplied by the National Statistical Institute (NSI);
- EUROMOD variables created and imputed by Eurostat because of restricted data access or knowledge in-house.

EUROMOD Country Report – CZECHIA

Based on the EMSD, the national team derives additional variables requiring a deep understanding of country specificities (for instance national tax-benefit rules). The final EUROMOD input dataset is therefore made of variables created by both Eurostat and national team.

Some of the EUROMOD variables produced by Eurostat are created and/or imputed with PDB (Production Database) variables. The reason being that the modalities of the PDB variables are more detailed than in UDB. According to the agreement between the NSI and Eurostat, the national team was allowed to use the more detailed information coming from the PDB to derive some EUROMOD variables or to use them as intermediate variable to impute other EUROMOD variables.

However, if the users want to compute their own EUROMOD input data with the formula provided in the DRD file, he/she may encounter differences for some EUROMOD variables because the PDB variables are not available.

3.2 Data adjustment

The national team did not adjust the original data provided in the EMSD database and all possible adjustments were done when EMSD database was created. These adjustments already included, for instance, the removal of children after the income reference period.

3.3 Imputations and assumptions

3.3.1 Time period

The definition of household is based on the sharing of expenditures concept, in line with the definition of Paragraph 115 of the Civil Code - based on the declaration of the persons in the dwelling that they permanently live together and pool their finances to cover their needs. As the 16 year olds those persons were regarded who had reached this age by 31 December 2018.

Reference periods:

- Demographic variables - age: 31 December 2018; marital status, education, housing, financial situation: the date of the interview.
- Work activity was collected for each month of 2018 as well as currently. Work activity figures are gathered by self-definition of the respondent (respondents themselves choose among different types of activity the one that fits them the most). Its value primarily depends on the respondent's main occupation and on the time spent in it. Subsequently, other data related to the respondent's work activity (status at work, profession) were collected as of the date of the interview. Parallel activities were surveyed (second job, study), together with data on receipt of pensions and parental benefits.
- Economic activity was not collected but derived from the monthly/yearly data (if monthly data was the basis, the activity with the highest incidence was coded as the yearly value). For those who completed their education in 2018 the latter half of the year was considered.
- Income data (both monetary and in kind): calendar year 2018.
- Subjective questions focused on housing and financial problems: the date of the interview.
- Health problems: last six or twelve months.
- Housing, consumer durables, financial and social situation of household: the date of the interview, unless the question specifically refers to some other period.

3.3.2 Gross incomes

Incomes related to household as a whole were collected at the household level. There were social benefits targeted at households, rental income and value of goods produced directly by the household through either private or professional activities.

Incomes collected at individual level: income from employment (main job, secondary jobs) incl. other income related to them (remunerations, shares, bonuses), income from contracts, income from self-employment, sickness benefits, old-age benefits, unemployment benefits, social benefits attributable at individual level (such as parental benefit or disability benefits) and other incomes (capital income, insurance claims).

Income from employment (both main job and possible secondary jobs) was collected both either gross of tax and social insurance or net, incomes from contracts only gross. Self-employed persons could choose from several ways to record the result of their enterprise. They could state the gross profit/loss according to their tax declaration, they could give the sum which served as the yearly basis for calculating their monthly health and social security contributions or could make their own estimate of their gross or net profit/loss. Family members co-operating in private enterprise run by another member of the family stated only proportionate part of the income from the business.

Rental income was collected either gross or net, based on what information respondents were able to provide. All other kinds of income were collected net and subsequently appropriate rules of the tax system were applied to estimate the gross amounts. In addition, the information was collected on claimed tax deductibles to enable calculation of taxes and social insurance contributions. Sum of individual net incomes then forms the main national indicator – net money income of the household.

Besides this national indicator of household income, it was necessary to construct an internationally comparable household income indicator, which is based on Eurostat methodology for EU-SILC surveys. This indicator is called disposable household income. The difference between these two definitions of the household income is in inclusion/exclusion of certain components of income (lump sum and irregular inter-household transfers, non-cash employment income, regular taxes on wealth).

Household income in kind consists of consumption of food, products and services originating from the household's own production activity (for example food or domestic animals from own farm, value of food from own restaurant, value of timber from own forest) and of perquisites provided by employers (company car, company-paid or co-financed meals and other non-cash paid services). The CZK value of own-production in kinds was calculated from reported amounts using the average price of the given commodity. The amount of CZK 3000 was added to income in kind of an employee for each month of using a company car. The financial contribution of the employer to the employee's meals was calculated using the number of meals, their actual price and the subsidized price that the employee paid for them. These contributions form an important part of employees' income.

Selected income components:

- Income from employment was defined in line with the national tax law. It includes income from employment based on a contract or similar arrangement between employer and employee. It also includes incomes of owners of the incorporated business from work for their company, income of members of statutory boards and other governing bodies of corporations, remuneration based on holding of elected public posts, income of apprentices in vocational schooling for their work undertaken as a part of their practical training and income from flexible short-term contracts under special regime set in the Labour Code. Using company car for private purposes is also classified as income in kind from employment.

- Income from self-employment includes also income from farming activities, if these are conducted as a business activity, income from independent professional practices (lawyers, doctors) and income from intangible assets (copyrights, royalties).

Income from main employment includes income of employees from their main job. For multiple coincident jobs, the declaration of the main job was left to the respondent.

Income from secondary employment includes salaries from secondary jobs, conducted besides the main job or self-employment activity of the respondent and income from flexible short-term contracts under special regime set in the Labour Code.

Income from secondary self-employment activity is analogous to the secondary employment income. It includes income from secondary self-employment activity undertaken in addition to the main job of the respondent (where respondent declared employment contract as his/her main job).

- Social income is in principle net. Gross amounts were included for cases of pensions above the tax-exempt limit. In these cases, tax was applied to the amount above this limit (CZK 396 400).

Sickness benefits include all sorts of benefits from the social sickness insurance, i.e. maternity leave benefit (note that the Czech system includes these into Sickness Benefits), reduced employment income compensation in pregnancy and motherhood, income support for persons caring for household member in need of short-term care (mostly care for children during their illness). Since 2009 sickness benefits include work inability compensation paid by the employer.

Other social support benefits include social benefits for foster parents taking care of adopted children, birth and death grants.

Other social benefits include certain benefits connected to the termination of employment in selected professions, various other social benefits like benefit for persons providing long-term homecare for their relative in need, support for care in spas and other social benefits for families with children, old and disabled citizens, which are mostly administered by the municipal authorities.

Social exclusion allowances include regular and lump sum monetary benefits that help the household pay their food and housing bills, or contribute to satisfy their basic needs.

Scholarships include all kinds of scholarship money income from schools and, furthermore, pocket money paid to apprentices by schools or future employers.

Social income from abroad, although the benefactor is not the government of Czechia went under respective rubrics and was mixed with the Czech government's help (pensions and child benefits).

- Other income

Income from capital contains interest from savings, bonds and various forms of deposits, dividends from shares, profits from incorporated businesses, income from investments abroad.

Other income includes income from occasional property rentals, life and material insurance, sale of own-produced goods, income from organisations not elsewhere classified (scholarships and pocket money of apprentices, grants from charity and non-governmental organisations), lottery winnings, prizes, pay for occasional not contracted jobs, regular inter-household transfers (alimonies and the like).

- **Housing costs:** In the case of more than one household in one dwelling unit, the costs were divided according to their actual contribution to their financing. When the household reported its housing costs only in one item as the rent paid for accommodation, the partial amounts were estimated based on the data from households, which provided the detailed information on their housing costs. Estimates were modelled by regression models taking into account the type of dwelling (family houses vs. other), type of rent (market rent vs. regulated rent contracts), number of household members and usual local level of housing costs (municipality, census enumeration unit).

3.3.3 Disaggregation of harmonized variables

UDB EU-SILC benefit variables include several country-specific benefits in different aggregated components. These components are categorized by type of benefit, e.g. family, social exclusion, housing, unemployment, old age, survivor, sickness, disability and education benefits. Furthermore, within each category the UDB EU-SILC also disentangles the benefits into 4 sub-components: contributory/non-contributory and non means-tested/means-tested.

This disaggregation leads, in some cases, to a direct identification of a single benefit into a specific UDB EU-SILC category. For example, the maternity allowance (*Peněžitá pomoc v mateřství*) can be directly linked to the UDB EU-SILC *hy052g* variable, recording contributory non means-tested family benefits, since no other benefit in Czechia fits under this category.

However, there are still some cases where the UDB EU-SILC categorization is not enough to link a single benefit to a single variable. This is the case, for instance, of the birth grant and the child allowance, both benefits recorded under UDB EU-SILC *hy053g* variable, containing non-contributory means-tested family benefits. In order to simulate these benefits in EUROMOD and also to validate their simulation against the information recorded in UDB EU-SILC, a further disaggregation of the UDB EU-SILC *hy053g* variable is required. The way followed to deal with this issue in the EUROMOD input dataset of Czechia is to combine the disaggregated income components of the national SILC with the UDB EU-SILC matching directly both datasets into the EMSD database. This can be done because, usually, the national SILC contains a higher level of benefit disaggregation than the UDB EU-SILC. As an example, Table 25 shows how family benefits have been disaggregated using the available information in the UDB EU-SILC together with the national SILC.

Table 25: Disaggregation of family benefits in CZ EUROMOD input dataset

Benefit name in national language	Benefit name in English	Contained in aggregated UDB variable	Contained in disaggregated UDB variable	Generated as an aggregated variable in the EUROMOD input dataset	Generated as a disaggregated variable in the EUROMOD input dataset
<i>Peněžitá pomoc v mateřství</i>	Income maintenance in the event of childbirth (<i>maternity allowance</i>)	HY050	HY052	bfa = HY050	bmaact = HY052
<i>Porodné</i>	Birth grant		HY053		bchba = HY053 - PRIDAV (<i>national SILC variable</i>)
<i>Přídavky na děti</i>	Family or child allowance				bch00 = PRIDAV (<i>national SILC variable</i>)

EUROMOD Country Report – CZECHIA

<i>Rodičovský příspěvek</i>	Parental leave benefit				bfapl = RODP (national SILC variable)
<i>Dávky péstounské péče (opakované)</i>	Other cash periodic benefits non means-tested (foster care benefits)		HY054		bfafp = PESTP (national SILC variable)
<i>Dávky péstounské péče (jednorázové)</i>	Other cash lump sum benefits non means-tested (foster care benefits)				

Note: the sum of the different disaggregated family benefits is equal to the aggregated component (bfa)

Updating

To account for any time inconsistencies between the input dataset and the policy year, updating factors are used. Each monetary variable (i.e. each income component) is updated to account for changes in the non-simulated variables that have taken place between the year of the data and the year of the simulated tax-benefit system. Updating factors are generally based on changes in the average value of an income component between the year of the data and the policy year. For detailed information about the construction of each updating factor as well as the sources that have been used, see Annex 1.

As a rule, updating factors are provided both for simulated and non-simulated income components present in the input dataset. Note, however, that in the case of simulated variables, the actual simulated amounts are used in the baseline rather than the updated original variables in the dataset. Updating factors for simulated variables are provided so as to facilitate the use of the model in cases when the user wishes to turn off the simulation of a particular variable.

4. VALIDATION

4.1 Aggregate Validation

EUROMOD results are validated against external benchmarks. Detailed comparisons of the number of people receiving a given income component and total yearly amounts are shown in Annex 3. Both market incomes and non-simulated taxes and benefits in the input dataset as well as simulated taxes and benefits are validated against external official data. The main discrepancies between EUROMOD results and external benchmarks are discussed in the following subsections. Factors that may explain the observed differences are also discussed.

4.1.1 Components of disposable income

This subsection outlines the differences in the definition of disposable income in EUROMOD and EU-SILC 2019. The major components of disposable income are the same in both sources: original incomes (+); benefits (+), taxes (-), employee social insurance contributions (-); and self-employed social insurance contributions (-). However, at the level of individual components there are the following differences (see Table 4.1):

- EU-SILC 2019 includes (imputed) annual value of (using) a company car, while EUROMOD definition of disposable income excludes this type of income;
- pensions from individual private plans are included in the disposable income concept in EUROMOD, while they are excluded in EU-SILC 2019;
- Disposable income in EU-SILC 2019 includes repayments/receipts on tax adjustment, while EUROMOD does not.

Apart from differences in the definition, the size of disposable income in EU-SILC and EUROMOD may differ for a given household as simulated income components in EUROMOD may differ for a number of reasons from their observed counterparts in EU-SILC dataset.

Table 4.1 Components of disposable income

	EUROMOD	EU-SILC 2019
	ils_dispy	HY020
Employee cash or near cash income	+	+
Employer's social insurance contribution	0	0
Company car	0	+
Contributions to individual private pension plans	0	0
Cash benefits or losses from self-employment	+	+
Pension from individual private plans	+	0
<i>Unemployment benefits</i>	+	+
<i>Old-age benefits</i>	+	+
<i>Survivor' benefits</i>	+	+
Sickness benefits	+	+
Disability benefits	+	+
Education-related allowances	+	+
Income from rental of a property or land	+	+
<i>Family/children related allowances</i>	+ ¹	+
Social exclusion not elsewhere classified	+	+
Housing allowances	+	+
Regular inter-household cash transfer received	+	+
Interests, dividends, etc.	+	+
Income received by people aged under 16	+	+
Regular taxes on wealth	-	-
<i>Regular inter-household cash transfer paid</i>	- ²	-
<i>Tax on income and social contributions</i>	-	-
<i>Repayments/receipts for tax adjustment</i>	0	+

Notes: ¹ includes income tax bonus; ² Maintenance payments

4.1.2 Validation of incomes inputted into the simulation

Market income

The number of unemployed is much higher and the number of employed is somewhat smaller in EUROMOD than in external statistics. The external statistics are taken from the Labor Force Survey data (see Table 4.2 in Annex 3), which tend to underestimate the number of unemployed. When we compare EUROMOD data with the administrative data on *registered* unemployment, the numbers are much closer (233K unemployed in EUROMOD vs. 242 K of registered unemployed in 2018⁹). Since the situation on the labour market further improved in 2019 and EUROMOD cannot capture this evolution, EUROMOD data underestimated the number of employed and overestimate the number of unemployed even more in 2019. Unemployment has risen in the following two years, so the EUROMOD data are a bit closer to external statistics.

Tables 4.3 and 4.4 show, respectively, the number of recipients and the total amount of different sources of market income. These incomes are used by the model but are not simulated. The number of recipients of employment income in EUROMOD matches very well the external statistics, but the number of self-employed is overestimated in EUROMOD. This might be due to the fact that external statistics do not include individuals who have both employment and self-employment income among the self-employed. The amount of employment income is underestimated in EUROMOD, while the self-employment income is overestimated.

⁹ Source: MPSV, Statistical yearbook of the labor market, 2018: <https://www.mpsv.cz/web/cz/statisticka-rocenka>

Underestimation of employment income likely stems from a well-known fact that individuals with very high incomes are not captured in survey data. The overestimation of self-employment income might be caused by the fact that the self-employed have the possibility to adjust their incomes for tax purposes, but they have no incentive to report lower incomes in surveys.

As commented in section 3, EUROMOD input data are adjusted for each policy year by updating factors that take into account average changes of each income source. Therefore, the number of recipients/payers of each income/benefit/tax is held constant in the EUROMOD input data.

Disability, old-age, survivor and sickness benefits

Tables 4.5 and 4.6 in Annex 3 show the number of recipients and total amount of pensions and benefits that are not simulated by EUROMOD, but which are used for the calculation of disposable income as they are reported in the input database.

- Pensions: in aggregate terms, pensions seem to be well represented in the EU-SILC and EUROMOD input data. Significant difference appears only in the number of disability pensioners, which is somewhat overestimated in the EUROMOD input data. However, the total amount of disability pensions paid seems to match the external statistics much better. In terms of pension amounts, all aggregate amounts fit very well, the only problem is with survivor's pensions which are slightly underestimated. The reason might be that the EUROMOD input data does not strictly distinguish what share of pension income comes from old-age pension and which from survivor's pension when the two pensions are collected by the same person (in survey data, this is often misreported, because people are only aware of the total amount of pension they receive and are often not able to distinguish which part comes from their old-age pension and which from a widow/widower pension).
- Sickness benefits: sickness benefits depend on previous wages of employees and they appear in the total monthly pay-check sum and are thus not well recognised and not remembered by employees. That explains why the amount of sickness benefits is largely underreported in the SILC data and thus in the EUROMOD input data. The underreporting got even more severe in 2020 when the take up of this benefit as well as expenditures for this benefit increased rapidly due to the COVID-19 pandemics.
- Maternity benefit: the number of recipients of maternity benefits in the EUROMOD is twice as large as in the external statistics. However, the two numbers are not directly comparable. EUROMOD calculates the number of recipients as the number of people who collected maternity benefit at some point in the previous year, while the external statistics show the monthly average number of recipients. Given that maternity benefit is collected for 6 months, the EUROMOD data should report twice as much recipients than the external data, which is indeed the case. The amount of maternity benefit is somewhat underestimated in the EUROMOD likely due to the fact that people do not recall very well the exact amount of the benefit they received, sometimes individuals confuse maternity benefit with parental allowance, which might also lead to underreporting in the benefit amount.
- Foster-care benefits: They include five different social benefits, some of which are aimed at covering the child's needs and some to financially support the foster parent. The external statistics combine all these into one number, but the foster parents are likely to perceive them differently. This is the likely reason why they are underestimated in the EUROMOD statistics when compared to external data.

Taxes and Social insurance contributions

Tables 4.5 and 4.6 in Annex 3 also show the number of recipients and total amount of taxes and social insurance contributions that are not simulated by EUROMOD. The only component not simulated in this regard is the property tax.

- Property tax is underreported in EUROMOD for all years (the number of payers is just slightly underreported, but the amount of property taxes paid is around 37% of the amount in external statistics). Our interpretation is that individuals underreport their incomes and property taxes in SILC, which was confirmed by our previous research and by the results obtained using the national microsimulation model.¹⁰

4.1.3 Validation of outputted (simulated) incomes

Unemployment, Family, Housing and Social assistance benefits

Tables 4.7 and 4.8 in Annex 3 show the number of recipients and the amount of tax-benefit instruments simulated by EUROMOD:

- Unemployment benefit: methods counting the number of recipients in EUROMOD and in external statistics are not strictly comparable. EUROMOD numbers are based on all individuals who reported receiving unemployment benefit sometime in the given year, while the external statistics show the number of individuals collecting unemployment benefits in a given month of a given year, averaged over all months. Therefore, the number of recipients is largely overestimated (ratio of 1.4-1.8) in EUROMOD. The comparison of total expenditures on unemployment benefits shows better results - the aggregate amounts in EUROMOD are a bit underestimated compared to external data, but this is to be expected given that the simulation is based on reported values of this benefit and (as with other social benefits), people often do not remember the correct amounts and tend to underreport them when asked retrospectively.
- Child allowance: EUROMOD simulations fit the number of recipients of child allowance very well in 2018 and 2019, and slightly overestimates it in 2020 (for 2020, EUROMOD simulates a small increase in the number of recipients, while in reality number of recipients continued to drop). Concerning the total amount, EUROMOD overestimates the aggregate amounts of child allowance quite substantially compared to external statistics, especially in 2020. The reason for this overestimation probably lies in the way EUROMOD model simulates the child allowance. The model assigns the whole annual amount of the allowance to all eligible families assuming eligible families collected the benefit for the whole year. However, the child allowance eligibility is examined each calendar quarter. Therefore, some families might only collect the allowance for one quarter of the year and not be eligible for the remaining three quarters. This might explain the lower annual amount of benefit that appears in external data.
- Parental allowances: results are stable and slightly overestimated for the number of recipients in 2018 and 2019, they fit much better in 2020 when we see an increase in the number of recipients in external data (likely caused by a large increase in the amount of benefit for those that still collect the benefit in 2020 that motivated some parents to increase the duration of benefit of benefit collection until 2020 and thus appeared as an increase in the number of recipients in external data in 2020). The aggregate amounts fit very well the external data although EUROMOD does not fully capture the increase in expenditures that happened in 2020 so for this year, EUROMOD simulations somewhat

¹⁰ See Dušek, L., Kalíšková, K., and Münich, D. (2013). Distribution of Average, Marginal, and Participation Tax Rates among Czech Taxpayers: Results from a TAXBEN Model. *Czech Journal of Economics and Finance*, 63(6), 474-504.

underestimate the overall expenditures. This is again likely caused by the behavioural response to the 2020 reform of parental allowance that motivated some parents to prolong the duration of the benefit collection, which EUROMOD cannot capture.

- Birth grant: Both the number of recipients and the overall amount of this benefit fits external data extremely well in 2018, but then the EUROMOD simulations diverge from external statistics which show a large drop in the number of recipients as well as expenditures on birth grant. This is likely caused by a drop in fertility that happened in 2019 and continued in 2020 and which EUROMOD cannot capture.
- Social assistance: Social assistance benefits have two main components – an allowance for living and a supplement for housing. The number of recipients of the supplement for housing is largely overestimated in EUROMOD. However, the statistics are not directly comparable - EUROMOD simulations are based on annual incomes, which are equally distributed over the twelve months, while the external statistics show the number of individuals collecting this supplement in a given month of a given year, averaged over all months. Therefore, possible fluctuations in monthly incomes are not captured in the simulations. Another reason might be a non-take-up of this benefit. Number of recipients of the allowance for living does not have the same problem even though the statistics are also not directly comparable. We hypothesize that the result is a combination of overestimation caused by the difference in statistics/non-take-up and underestimation caused by the fact that people receiving social assistance benefits are often not represented in the SILC data. EU-SILC only covers households living in private dwellings, while individuals collecting social assistance benefits often live in provisional or institutional housing (like lodging houses or old people's homes) in socially excluded areas, and are thus not part of the EUROMOD simulations. This is also the likely reason why overall amounts of both social assistance benefits are underestimated in EUROMOD.
- Housing benefit: The number of recipients is largely overestimated in EUROMOD compared to external statistics. Similarly to the social assistance benefits above, this is probably due to conceptual differences (EUROMOD simulations are based on annual incomes and possible fluctuations in monthly incomes are not captured) or the low take-up rate of this benefit. Note that a similar problem has been found using the Czech national tax-benefit microsimulation model¹¹ and some studies estimated the take-up of housing benefit to be less than 50%.¹² On the other hand, the aggregate amounts are slightly underestimated in EUROMOD. Similarly to social assistance benefits, this could also be due to the fact that people receiving housing benefit are often not represented in the SILC data and the simulated amounts thus do not take into account those households that are eligible but do not live in private dwellings so are not part of the input data. Also, the housing benefit amount is derived from the housing costs, which are often underestimated in survey data, so that EUROMOD might underestimate the benefit amount due to low reported housing costs.
- Finally, in 2020 a one-off pension bonus of 5,000 CZK was approved, whose simulation depicts around 2,89 million of recipients corresponding to a total expenditure 14,45 billion. While there are not external statistics to validate this one-off bonus, it was paid to all individuals receiving old-age, disability or survivors pension, so we can easily calculate the number of recipients based on external data about number of pensioners and the over amount based on this number multiplied by 5,000. Since

¹¹ See Dušek, L., Kalíšková, K., and Münich, D. (2013). Distribution of Average, Marginal, and Participation Tax Rates among Czech Taxpayers: Results from a TAXBEN Model. *Czech Journal of Economics and Finance*, 63(6), 474-504.

¹² Mareš (2001). Problém nečerpání sociálních dávek [The problem of non-take-up of social benefits]. VÚPSV Praha v.v.i.

pensioners are quite accurately represented in SILC data (see Table 4.5), the validation of this one-off bonus is also very successful.

Taxes and Social insurance contributions

Tables 4.7 and 4.8 in Annex 3 show the number of payers and amounts of social insurance contributions and taxes simulated by EUROMOD:

- Employee and employer contributions: the number of people paying contributions and the overall amount of contributions simulated by EUROMOD fits external statistics very well.
- Self-employed contributions: EUROMOD estimates of the number of the self-employed paying social security contributions match external data very well. However, EUROMOD underestimates the total amount of contributions paid by the self-employed. This might be due to the fact that some self-employed can decide to pay higher than minimum contributions (or participate in the voluntary sickness insurance system – e.g. to become eligible for maternity allowance) and the model cannot capture that.
- Income tax: Number of taxpayers paying income tax is slightly underestimated by EUROMOD. The reason is that EUROMOD calculates the number of taxpayers as the number of individuals paying *positive* income tax, while in the external statistics the number of taxpayers is the number of employees or self-employed individuals, no matter whether they pay positive or zero taxes (there are no external statistics on the number of people paying positive income taxes). The number of taxpayers paying zero taxes is quite substantial because of generous tax credits and tax deductibles. The amount of income tax collected thus corresponds to external statistics much better.

4.2 Income distribution

4.2.1 Income inequality

The income distribution indicators in EUROMOD are very close to the external statistics (See Annex 3, Table 4.9). Some differences appear in case of households at the bottom and top of income distribution. Underestimation of top incomes might be due to incomplete reflection of all possible tax base deductions (caused by the lack of necessary information in the SILC data), but also because households with the highest lowest incomes are usually underrepresented in survey data. Similarly, the slight overestimation of incomes in the bottom income deciles is likely caused by underrepresentation of the lowest income households in the underlying survey data.

Table 4.9 also provides the following indicators of income distribution: mean and median equivalised income¹³, income quintile ratio, and Gini coefficient. According to results, the mean and median equivalised disposable incomes in EUROMOD are slightly smaller compared to the external statistics. The difference small and likely caused by the underrepresentation of individuals with the highest incomes in the underlying survey data, which is a common phenomenon. Income inequality is also slightly lower in EUROMOD. This is consistent with results obtained in other countries. In case of Czechia, the higher number of recipients of housing benefit (which is mostly received by lower income families) is likely to be one of the factors reducing income inequality in EUROMOD simulations.

4.2.2 At-risk-of-poverty rates

Table 4.10 in Annex 3 provides the at-risk-of-poverty rates using poverty lines based on 40, 50, 60 and 70% of the median equivalised disposable income. At-risk-of-poverty rates for 2018 are

¹³ Using the OECD modified equivalence scale.

somewhat lower in EUROMOD (compared to external statistics from Eurostat) when using less generous poverty line (40% of the median). This suggests that families with lowest incomes are likely underrepresented in EUROMOD. As already suggested above, it is also possible that the overestimation of housing benefits (given a very high non-take-up of this benefit in reality) contributes to the underestimation of poverty rates. For other poverty lines, the poverty rates in EUROMOD are very close to external statistics for both 2018 and 2019.

Table 4.10 also shows the at-risk-of-poverty rates (using 60% of the median equivalised disposable income as poverty line) by age groups. For the youngest (0-15 years) and the oldest (65+) groups, EUROMOD estimates somewhat lower poverty rates than what external statistics suggest. This again likely due to the non-take up of housing benefit, which is especially pronounced among the elderly. The at-risk-of-poverty rates for other age groups match the external statistics well.

4.3 Summary of “health warnings”

This final section summarises the main findings concerning special aspects of the Czech part of EUROMOD or its database that should be borne in mind when planning appropriate uses of the model and when interpreting results.

- The SILC sample is relatively small. Care should be taken in interpreting results for small population sub-groups.
- The weights do not control for differential non-response according to any dimension.
- There is underreporting by people with very low incomes, but also those with higher incomes and with higher share of self-employment income and incomes from investment. Figures for incomes of the self-employed are in principle not very reliable since some portion of accounting expenditure made by the self-employed effectively covers common living expenditures.
- Sickness insurance benefits are substantially underreported in SILC since people do not recognize them easily in their pay checks. Information in SILC does not allow for well-informed simulations of these benefits.
- Some segments of the population are not sufficiently represented in the SILC sample (minorities, foreigners, homeless people).
- Some values of some observations have been imputed already by the Statistical Office and cannot be disentangled from the released data.
- Parental leave benefits are simulated and defined in an extension (Parental Benefits Extension) that is switched off in the baselines, i.e. the non-simulated component (*bmact*) is being used. When the extension is switched on, the non-simulated component is replaced by the simulated one (*bmact_s*). Switching on the extension will also trigger the simulation of the paternity benefit (*bpact_s*: from 2018 onwards) and the extended simulation of the parental allowance (*bfapl_s*). The simulated numbers might differ significantly from external statistics as some policy rules cannot be simulated accurately due to lack of information in the underlying data.
- The simulation of monetary compensation schemes (*yemcomp_cz* & *ysecomp_cz*) is triggered by the simulation of labour market transitions defined in policy *TransLMA_cz*. This policy becomes operational if the model is run in conjunction with the LMA add-on. The nature of these simulations is still experimental and only partially validated. Users are encouraged to refer to the “*Simulating labour market transitions in EUROMOD*” document prior to their use.

- Labour market transitions are switched OFF in EUROMOD baselines. As a consequence, the simulation of monetary compensation schemes does not produce any effect in baseline simulations. Since all policies not linked to labour market transitions are fully functional, it is possible for disposable income in 2020 to be higher than disposable income in previous years.

ANNEX 1. UPRATING FACTORS

Index	2018	2019	2020	2021	Sources
Harmonised Index of Consumer Prices	105.1	107.8	111.4	114.2	Eurostat (http://ec.europa.eu/eurostat/data/database); 2021 - Ministry of Finance forecast (http://www.mfcr.cz/cs/verejny-sektor/prognozy/makroekonomicka-predikce)
Main child benefit (pridavek na dite)	777	794	794	794	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2020, 2021 - assume uprating factor of 1 (no change in policy rules, no indexation)
Foster parent benefit (pestounska pece celkem)	11080	11307	11307	11307	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2020, 2021 - assume uprating factor of 1 (no change in policy rules, no indexation)
Parental leave benefit (rodicovsky prispevek)	7374	7189	9777	9777	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2020 - assume uprating factor of 1.36 as the total amount of allowance was increased by 36%; 2021 - assume uprating factor of 1 (no change in policy rules, no indexation)
Housing benefit (prispevek na bydleni)	3461	3558	3558	3558	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2020, 2021 - assume uprating factor of 1 (no change in policy rules, no indexation)
Unemployment benefit	7013	7575	8217	8388	Ministry of Labour and Social Affairs (https://www.mpsv.cz/web/cz/struktura-uchazecu)
Harmonised CPI (index 2005=100)	129	132	137	140	Eurostat (http://ec.europa.eu/eurostat/data/database); 2021 - Ministry of Finance forecast (http://www.mfcr.cz/cs/verejny-sektor/prognozy/makroekonomicka-predikce)
Disability pension	8444	9135	9736	10300	Czech Social Security Administration (https://www.cssz.cz/web/cz/duchodova-statistika#section_2); 2021 - annual indexation
Old-age pension	12418	13468	14479	15318	Czech Social Security Administration (https://www.cssz.cz/web/cz/duchodova-statistika#section_2); 2021 - annual indexation
Survivor pension	6982	7721	8314	8796	Czech Social Security Administration (http://www.cssz.cz/cz/o-cssz/informace/statistiky/duchodova-statistika/); 2005-2010: values calculated based on the growth in pensions of widows and widowers and based on absolute values from 2011; 2021: annual indexation
Housing costs	34332	36167	37375	38314	Czech Statistical Office (https://www.czso.cz/csu/czso/spotrebni-vydaje-domacnosti-2019); 2020, 2021: assume uprating factor equal to the harmonised CPI
Housing costs, rent	34332	36167	37375	38314	Czech Statistical Office (https://www.czso.cz/csu/czso/spotrebni-vydaje-domacnosti-2019); 2020, 2021: assume uprating factor equal to the harmonised CPI
Employment income	31885	34125	35611	36737	Czech Statistical Office (https://www.czso.cz/csu/czso/cri/prumerne-mzdy-4-ctvrtleti-2020); 2021 - Ministry of Finance forecast (https://www.mfcr.cz/cs/verejny-sektor/makroekonomika/makroekonomicka-predikce)
Previous employment income	29504	31885	34125	34125	Calculated based on \$ _{pr_yem} lagged by 1 year
Maternity benefit	188594	202800	207216	210492	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2005-2009 - extrapolated from 2010 using the employment income growth index; 2020, 2021 - assume uprating factor equal to half of the employment income growth
Birth grant	11276	11219	11219	11219	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2020, 2021 - assume uprating factor of 1 (no change in policy rules, no indexation)
Other family benefits (porodne a pohrebne)	8131	8105	8105	8105	Czech Statistical Office (https://www.czso.cz/csu/czso/vybrane-udaje-o-socialnim-zabezpeceni-2019); 2020, 2021 - assume uprating factor of 1 (no change in policy rules, no indexation)
Led index of employment income	34125	35611	36737	36737	Calculated based on \$ _{f_yem} led by 1 year

ANNEX 2. POLICY EFFECTS IN 2020-2021

Table A2.1 and Figure A2.1 show the effect of policy changes in 2020-2021 on the mean equivalised household disposable income by income component and income decile group, as a percentage of mean equivalised household disposable income in 2020. The effect is estimated as a difference between simulated household net income under the 2021 tax-benefit policies (deflating monetary parameters by *projected* Eurostat's Harmonized Index of Consumer Prices, HICP) and net incomes simulated under 2020 policies.

Overall, the real disposable income of the population has increased by 3.33% between years 2020 and 2021. The largest increase in disposable income was in the top deciles (ninth decile gained the most – 4.85%), while the bottom deciles gained less (about 1 to 2 percent in the second to fourth decile) and the first decile was the only one that lost on their disposable income (drop by 0.48%).

The main driving force behind the increase in disposable incomes was caused by the reform of income tax. Starting 2021, the tax base for income tax was modified. It no longer includes social security contributions paid by the employer. This virtually decreased the tax base for income tax purposes by 25% for all employees. The tax rates stayed the same, which led to a large decrease in taxes paid and thus an increase in disposable incomes. This change did not affect individuals in the bottom deciles of income distribution, because they either do not work or they do work, but they did not pay any income taxes even before this reform because of a generous system of tax credits and tax deductions.

Disposable incomes of the bottom deciles are also higher in 2021 thanks to an increase in means-tested child benefits – the monthly amounts of these benefits increased by about 25% in 2021 compared to 2020.

Finally, public pensions increased for all but the very first decile (most likely this drop is caused by the fact that in 2020 all pensioners received a flat-rate one-off bonus of CZK 5,000, which they no longer received in 2021 and the 2021 annual valorization of pensions could not catch up with this large one-off payment in the bottom decile).

There were several factors that also decreased the disposable incomes in 2021. Above all, there was a relative increase in social security and health contributions paid by self-employed driven by the fact that self-employed were no longer exempt from paying minimum contributions as in 2020 (a COVID-19 measure). In 2020, when this was in force, all self-employed gained CZK 4896 (sum of minimum contributions for social and health insurance) per month over six months. The relative importance of this measure was thus higher for the lower deciles (that is why they experience a larger drop in disposable incomes in 2021), but it affected disposable incomes in all deciles.

Table A2.1. Policy effects in 2020-2021, using the CPI-indexation (CPI = 1.0244), %
