1 Introduction

This document provides a short overview of the main features of the Marginal Tax Rate (MTR) Add-on. The description is mainly based on the following publication: Jara and Tumino (2013); as well as the following manual of the EUROMOD help: *EUROMOD add-ons and the special functions AddOn_Applic, AddOn_Pol, AddOn_Func and AddOnPar*.

The MTR Add-on allows computing marginal tax rates (MTRs) for all countries and policy years in EUROMOD. MTRs are “an indicator of the proportion of a marginal increase in earnings that is taxed away due to social insurance contributions, taxes and loss of benefit entitlement” (Jara and Tumino, 2013). They are expressed in percentage and they usually vary between 0 and 100%¹. They are computed only for individuals declaring positive earnings and, therefore, they can be interpreted as a proxy of labour market incentives at the intensive margin of labour supply².

In short, the MTR Add-on complements the countries’ spines by adding some extra policies which allow running and storing the results of policy systems twice: first, by running baselines’ policies and, second, by rerunning them with increased earnings. Here it must be noted that earnings are increased in turn for each earner in the household. All the above is implemented in EUROMOD through a primary loop of 2 iterations and a secondary loop of as many iterations as members with positive earnings within the household (see section 2 *MTR_PREP* for more details). Results are stored individually and differences in household disposable income between the 2nd and 1st run are computed (see equation 1).

$$(1) \quad \mathbf{MTR} = 1 - \left(\frac{Y_{HH}^1 - Y_{HH}^0}{E_i^1 - E_i^0} \right) = 1 - \left(\frac{\Delta Y_{HH}}{\Delta E_i} \right),$$

where Y_{HH}^1 is the household disposable income in the 2nd run after the increase in earnings, Y_{HH}^0 is the household disposable income in the 1st run and ΔE_i is the individual increase in earnings.

Moreover, given the advantage in EUROMOD of decomposing disposable income into its different detailed components, MTRs are decomposed in the Add-on as follows: original income³, public pensions (*mtrpc_pen*), means-tested (*mtrpc_benmt*) and non means-tested benefits (*mtrpc_bennt*), taxes (*mtrpc_tax*) and social insurance contributions paid by the employee (*mtrpc_sicee*), self-employed (*mtrpc_sicse*) and others (*mtrpc_sicot*).⁴

¹ Although there might be cases where MTRs can be negative or above 100%. The latter arises from decreases in household disposable income which overcome the increase in earnings, while the former are due to increases of household disposable income of higher magnitude than the increase in earnings (see Jara & Tumino, 2013 for more information).

² A marginal increase in earnings can occur through different sources such as working more hours in the same job, moving or promoting to a better-paid job, getting bonus payments on top of the base salary, etc. (Adam and Browne, 2010).

³ This component will be 0 as the change in original income is equal to the marginal increase in earnings.

⁴ Paid, for example, by pensioners.

2 Specific aspects and assumptions applied in the Add-on

MTRs are only computed for those individuals with positive earnings ($ils_earns > 0$).

Full take-up and full tax compliance are assumed.

The default marginal increase of earnings is of 3% of gross earnings in the baseline.

3 Structure of the MTR Add-on

EUROMOD Add-ons are structured in a similar way as EUROMOD country models, i.e. they have a policy spine consisting of several policies. The policies in the Add-ons do not describe the rules of taxes or benefits of the baseline but perform additional operations, i.e. increasing earnings by a specific margin and recalculating tax liabilities and benefit entitlements.

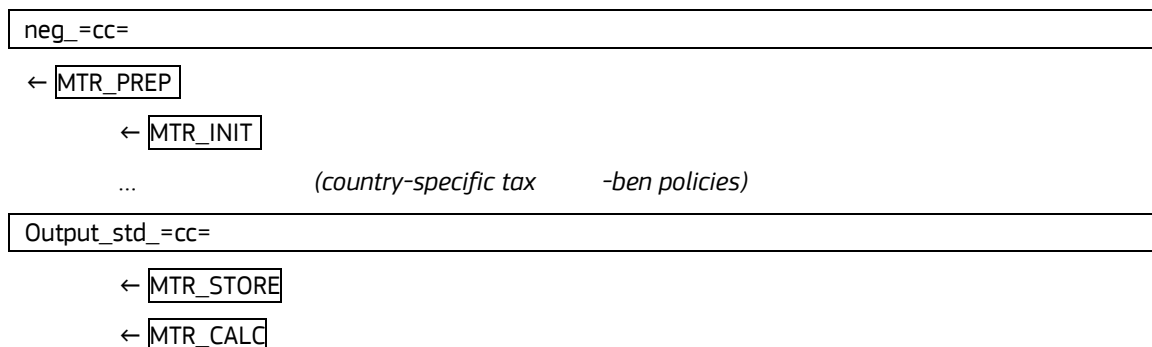

The MTR Add-on is composed of a general system (MTR) which applies to some countries (CZ, HU, LU, SE) and several additional country-specific systems (MTR_=cc=, where =cc= stands for the country acronym) for which some country-specific adjustments are needed. In any case, all systems are composed of 5 policies with different functionalities. They are described below:

3.1 ao_control_MTR

This policy defines which country systems the Add-on can be run with (func_AddOn_Applic) and which additional MTR policies are added to the policy spine and where (func_AddOn_Pol). Note that the policies themselves are defined in separate policies which are described in the subsequent sections. Besides, the MTR Add-on is intended to work with all policy systems-datasets combinations.

The placement of the Add-on in the country-specific policy spines is described in Figure 1. In general, MTRs calculations starts right after the neg_=cc= policy and they mainly involve the running of each country-specific tax and benefit policies without and with the increase in earnings⁵. Tax compliance and benefit take-up adjustments are switched off at this point, i.e. full compliance with the policy rules and full take-up of benefits are assumed (func_AddOn_Extension). Moreover, the policy ao_control_MTR restricts the standard output policy to the baseline results only (func_AddOn_Par) so they are not overwritten after the marginal increase in earnings.

Figure 1. MTR Add-on location in the country spine

3.2 MTR_PREP

MTR_PREP applies some general adjustments needed before the looping of tax-benefit policies: e.g. define the marginal increase in earnings (3% by default); define new tax units (TUs), income lists (ILs) and variables, etc. Before the loops start, baseline's gross earnings (i.e. ils_earn and all its components) are stored at the individual level (func Store).

Then, two loops are defined/started in order to calculate tax liabilities and benefit entitlements before and after the increase in earnings:

- Primary loop (named MTR_BASE) (func_Loop): 1st run is the baseline, 2nd run is with increased earnings. The loop starts right after the policy MTR_PREP and finishes before MTR_CALC.
- Secondary loop (named MTR) (func_UnitLoop) within the 2nd run of the primary loop: earnings are increased for each person in the household in turn, therefore, the number of runs depends how many people with positive earnings there are in the household. The secondary loop goes from MTR_INIT to MTR_STORE.

⁵ Note here that the location policies are inserted is slightly different for some countries (LT & SI) as some previous calculations are needed before running the MTR Add-on.

Figure 2 in the Appendix depicts graphically the way taxes and benefits are looped so to compute MTRs.

3.3 MTR_INIT

This policy allows, mainly, increasing earnings (ils_earnings and all its components) for one person at a time in each household (func_ILVarOp). This is achieved through the use of the parameter IsCurElig_mtr which identifies, for each household, all those individuals with positive earnings, i.e. the variable is true for individuals with ils_earnings > 0 and false for all others.

Besides, any country-specific adjustments, e.g. recalculating certain variables, switching off certain policies that should not be rerun for technical reasons (func_ChangeParam), etc. are applied in this policy.

Note that in this policy the name of the EUROMOD standard output is renamed to =sys=_base_mtr, where =sys= stands for the name of the policy system. This needs to be done to clearly distinguish the standard MTR output from the standard baseline output (=sys=_std), as the former assumes full take-up and full compliance with the policy rules, whereas the latter might include any of the above-mentioned adjustments.

3.4 MTR_STORE

This policy stores the baseline results (func_Store, postloop=mtr_base); by default all standard income lists (ils_*) and their components. Note that all variables are stored at the individual level.

Additionally it stores the results with increased earnings (func_Store, postloop=mtr); by default all standard income lists (ils_*) and their components:

- note there are two types of IL/variables: (i) for each MTR run (with a suffix _MTR1, _MTR2, etc.) and (ii) 'composite' IL/variables (with a suffix _MTR) containing information only from the relevant run for each person.
- variables for a specific MTR run have missing values (i.e. void) for people from households not included in that run; 'composite' variables have missing values for people with no earnings.
- variables for a specific MTR run are stored at the individual level independent of level-parameters, while all 'composite' variables (except earnings) are stored at the household level (as level=tu_household_mtr and il2_level=tu_individual_ =cc=).

Finally, earnings variables are restored to its original value at the beginning of each iteration (func_Restore).

3.5 MTR_CALC

The last policy of the MTR Add-on defines and calculates MTR-related indicators:

- change in earnings (ils_earnings_diff)
- MTR in percentage (mtrpc)
- MTR components in percentage, such that $mtrpc = mtrpc_pen + mtrpc_benmt + mtrpc_bennt + mtrpc_tax + mtrpc_sicee + mtrpc_sicse + mtrpc_sicot$

MTR_CALC also generates a separate output for MTR results (=sys=_mtr, where =sys= stands for the name of the policy system), outputting, by default, the initial earnings (ils_earnings_backup), initial employee earnings (yem_backup), all (standard) income lists in the baseline and MTR-related indicators, e.g. variables named mtr*, *mtr or *diff.

- note that missing values for variables from the MTR loop (see MTR_STORE) are replaced with 9999999
- Besides, additional variables can be outputted (see Appendix: adding extra variables to the MTR output for guidelines).

Figure 2. Looping of tax-ben policies in the MTR Add-on

Adding extra variables to the MTR output

Note that in general, output function parameters `ilgroup` and `vargroup` do not include stored results (for technical reasons). There are two exceptions which are already included in the default setup: (standard) income lists for the baseline run (`ilgroup=*mtr_base1`) and 'composite' IL/variables for the MTR run (both with `vargroup=*mtr`).

To output additional information:

- Initial earnings variables
 - If the variable is not a component of `ils_earn` then add to `func_Store` in `MTR_PREP`, e.g. `varX=yse00`; note that if an income list is stored its components are stored as well.
 - Add to `func_DefOutput` in `MTR_CALC`, e.g. `varX=yse00_backup`.
- Baseline results⁶
 - Add the variable/IL to `func_Store` in `MTR_STORE` (`postloop=mtr_base`) unless already included, e.g. `varX=temp_rand`, `ilX=il_SA_means`; note that if an income list is stored its components are stored as well.
 - Add to `func_DefOutput` in `MTR_CALC`, e.g. `varX=bsa00_s_mtr_base1`, `ilX=il_SA_means_mtr_base1`.
- Results from a specific MTR run
 - Add the variable/IL to `func_Store` in `MTR_STORE` (`postloop=mtr`) unless already included, e.g. `varX=temp_rand`, `ilX=il_SA_means`; note that if an income list is stored its components are stored as well.
 - Add to `func_DefOutput` in `MTR_CALC`, e.g. `varX=bsa00_s_mtr2`, `ilX=ils_dispy_mtr3`.
- 'Composite' results from the MTR loop
 - Add the variable/IL to `func_Store` in `MTR_STORE` (`postloop=mtr`) unless already included, e.g. `varX=temp_rand`, `varX=il_SA_means`; note that (i) both use `varX`-parameter, (ii) 'composite' results are not constructed for income list components (and hence need to be specified separately).

⁶ As earning variables should be part of disposable income, this is another way of inputting initial earnings variables (as `yem_backup` should equal `yem_mtr_base1`). Furthermore, the usual baseline output is written into a separate variable.

- note that no changes are needed for func_DefOutput in MTR_CALC as all stored variables ending with “_mtr” are already outputted in the default setup.

GETTING IN TOUCH WITH THE EU

In person

All over the European Union there are hundreds of Europe Direct centres. You can find the address of the centre nearest you online (european-union.europa.eu/contact-eu/meet-us_en).

On the phone or in writing

Europe Direct is a service that answers your questions about the European Union. You can contact this service:

- by freephone: 00 800 6 7 8 9 10 11 (certain operators may charge for these calls),
- at the following standard number: +32 22999696,
- via the following form: european-union.europa.eu/contact-eu/write-us_en.

FINDING INFORMATION ABOUT THE EU

Online

Information about the European Union in all the official languages of the EU is available on the Europa website (european-union.europa.eu).

EU publications

You can view or order EU publications at op.europa.eu/en/publications. Multiple copies of free publications can be obtained by contacting Europe Direct or your local documentation centre (european-union.europa.eu/contact-eu/meet-us_en).

EU law and related documents

For access to legal information from the EU, including all EU law since 1951 in all the official language versions, go to EUR-Lex (eur-lex.europa.eu).

Open data from the EU

The portal data.europa.eu provides access to open datasets from the EU institutions, bodies and agencies. These can be downloaded and reused for free, for both commercial and non-commercial purposes. The portal also provides access to a wealth of datasets from European countries.

Science for policy

The Joint Research Centre (JRC) provides independent, evidence-based knowledge and science, supporting EU policies to positively impact society
