

EUROMOD software v3.5.2

What's new?

Compared to previous release (v.3.5.1), this software version includes the following updates/changes:

- **Core software:**

- Added support for the incomelist “ils_extstat_other”, which you can define in “IlsDef_cc” in order to introduce other external statistics. **IMPORTANT!** The correct name is “ils_extstat_other”! The extra “s” in “ils_extstats_other” which appears in the statistics report is a typo! It has been already corrected in the code and will be included in the next release.
- Added a new column in the External Statistics where you can define the “destination” of an ils component for the aggregates (not for distributional). For all default ils in the aggregates, you should see only the default destination or “None” and for the “ils_extstat_other” you should see all available destinations.
- The produced statistics report now includes the variables you selected. Each aggregate table will also include “ils_extstat_other” in the end, whether it shows as empty or not. Every ils that has at least one component hidden, should display a warning in the ils header.
- The external statistics are also available in the spine in the form of constants. The aggregate statistics are available as “\$extstat_number_*” and “\$extstat_amount_*”, while the distributional and poverty statistics are available as “\$extstat_*
