

EUROMOD software v3.5.5

What's new?

Compared to the release (v.3.5.2), this software version includes the following updates/changes:

▪ **Core software:**

- Fixed a bug where distributional statistics were not properly read from the country file
- Made the Macrovalidation window non-modal (so you can interact with the EUROMOD UI on the back)
- The Statistics now automatically appear on top
- The Macrovalidation form remembers its settings
- Made sure that `ils_extstat_other` is read only at the first level
- Improved the combobox options in the Destination column of external statistics
- `ils_extstat_other` row is completely hidden in the statistics if there is no component to show in the current table
- Added the "AutoRenameWhenCopying" parameter which decides whether filenames should be auto-renamed in DefInput & DefOutput functions when copying/renaming a system (required for ITT)
- Added support for Indirect Taxes and External Statistics in the Merge tool
- Added Indirect Taxes in Intellisense
- Merge Tool: Allowed setting multiple selected rows to Accept/Reject at once (select multiple rows with shift or ctrl)
- Income lists in external statistics will always be in sync with the spine
- The order of External Statistic components should now always match the order in the spine
- Fixed a bug in the macrovalidation statistics where some elements did not appear properly.

▪ **Plugins:**

- Fixed typo in statistics presenter showing an extra "s" in "`ils_extstat_other`"
- Fixed a bug that would crash Macrovalidation if the outputs of different systems are identical. Now it will pick always the first system found instead.
